PROPOSAL FOR (COLOMBIA, ECUADOR)
Background

1. The strategic priorities, policies and guidelines of the Adaptation Fund (the Fund), as well as its operational policies and guidelines include provisions for funding projects and programmes at the regional, i.e. transnational level. However, the Fund has thus far not funded such projects and programmes.

2. The Adaptation Fund Board (the Board), as well as its Project and Programme Review Committee (PPRC) and Ethics and Finance Committee (EFC) considered issues related to regional projects and programmes on a number of occasions between the Board’s fourteenth and twenty-first meetings but the Board did not make decisions for the purpose of inviting proposals for such projects. Indeed, in its fourteenth meeting, the Board decided to:

   (c) Request the secretariat to send a letter to any accredited regional implementing entities informing them that they could present a country project/programme but not a regional project/programme until a decision had been taken by the Board, and that they would be provided with further information pursuant to that decision

   (Decision B.14/25 (c))

3. In its eighth meeting in March 2012, the PPRC came up with recommendations on certain definitions related to regional projects and programmes. However, as the subsequent seventeenth Board meeting took a different strategic approach to the overall question of regional projects and programmes, these PPRC recommendations were not included in a Board decision.

4. In its twenty-fourth meeting, the Board heard a presentation from the coordinator of the working group set up by decision B.17/20 and tasked with following up on the issue of regional projects and programmes. She circulated a recommendation prepared by the working group, for the consideration by the Board, and the Board decided:

   (a) To initiate steps to launch a pilot programme on regional projects and programmes, not to exceed US$ 30 million;

   (b) That the pilot programme on regional projects and programmes will be outside of the consideration of the 50 per cent cap on multilateral implementing entities (MIEs) and the country cap;

   (c) That regional implementing entities (RIEs) and MIEs that partner with national implementing entities (NIEs) or other national institutions would be eligible for this pilot programme, and

   (d) To request the secretariat to prepare for the consideration of the Board, before the twenty-fifth meeting of the Board or intersessionally, under the guidance of the working group set up under decision B.17/20, a proposal for such a pilot programme based on consultations with contributors, MIEs, RIEs, the Adaptation Committee, the Climate Technology Centre and Network (CTCN), the Least Developed Countries Expert Group (LEG), and other relevant bodies, as appropriate, and in that proposal make a recommendation on possible options
on approaches, procedures and priority areas for the implementation of the pilot programme.

(Decision B.24/30)

5. The proposal requested under (d) of the decision above was prepared by the secretariat and submitted to the Board in its twenty-fifth meeting, and the Board decided to:

(a) Approve the pilot programme on regional projects and programmes, as contained in document AFB/B.25/6/Rev.2;

(b) Set a cap of US$ 30 million for the programme;

(c) Request the secretariat to issue a call for regional project and programme proposals for consideration by the Board in its twenty-sixth meeting; and

(d) Request the secretariat to continue discussions with the Climate Technology Center and Network (CTCN) towards operationalizing, during the implementation of the pilot programme on regional projects and programmes, the Synergy Option 2 on knowledge management proposed by CTCN and included in Annex III of the document AFB/B.25/6/Rev.2.

(Decision B.25/28)

6. Based on the Board Decision B.25/28, the first call for regional project and programme proposals was issued and an invitation letter to eligible Parties to submit project and programme proposals to the Fund was sent out on 5 May 2015.

7. In its twenty-sixth meeting the Board decided to request the secretariat to inform the Multilateral Implementing Entities and Regional Implementing Entities that the call for proposals under the Pilot Programme for Regional Projects and Programmes is still open and to encourage them to submit proposals to the Board at its 27th meeting, bearing in mind the cap established by Decision B.25/26.

(Decision B.26/3)

8. According to the Board Decision B.12/10, a project or programme proposal needs to be received by the secretariat no less than nine weeks before a Board meeting, in order to be considered by the Board in that meeting.

9. The following project pre-concept document titled “Building adaptive capacity through food and nutrition security and peace-building actions in vulnerable Afro and indigenous communities in the Colombia-Ecuador border area” was submitted by the World Food Programme (WFP), which is a Multilateral Implementing Entity of the Adaptation Fund.

10. This is the second submission of the proposal. It was first submitted as a pre-concept in the twenty-sixth Board meeting and the Board decided to:

   a) Not endorse the project pre-concept, as supplemented by the clarification response provided by the World Food Programme (WFP) to the request made by the technical review;
b) Suggest that WFP reformulate the proposal taking into account the observations in the review sheet annexed to the notification of the Board’s decision, as well as the following issues:

   (i) The proposal should further demonstrate the relevance and the added value of the regional approach;

   (ii) Upon justification of the regional approach, the proposed activities should be reformulated in order to achieve the regional objective, demonstrating innovation in the approach; and

   c) Request WFP to transmit the observations under item (b) to the Governments of Colombia and Ecuador.

   (Decision B. 26/23)

11. The present submission was received by the secretariat in time to be considered in the twenty-seventh Board meeting. The secretariat carried out a technical review of the project proposal, assigned it the diary number LAC/MIE/Food/2015/1, and completed a review sheet.

12. In accordance with a request to the secretariat made by the Board in its 10th meeting, the secretariat shared this review sheet with WFP, and offered it the opportunity of providing responses before the review sheet was sent to the PPRC.

13. The secretariat is submitting to the PPRC (1) the summary of the project and, (2) in accordance with decision B.25.15, a response table explaining where and how the observations made by the Board when not approving the project pre-concept at its twenty-sixth meeting had been addressed by the proponent in the project pre-concept submitted for this meeting. Also, pursuant to decision B.17/15, (3) the final technical review of the project is presented in the following sections, along with (4) the final submission of the proposal. The proposal is submitted with changes between the initial submission and the revised version highlighted.

14. Lastly, WFP has submitted a Project Formulation Grant Request, which is also available as an addendum to this document.
Project Summary

Colombia, Ecuador – Building adaptive capacity through food and nutrition security and peace-building actions in vulnerable Afro and indigenous communities in the Colombia-Ecuador border area

Implementing Entity: WFP
  Project/Programme Execution Cost: USD 1,119,458
  Total Project/Programme Cost: USD 12,903,226
  Implementing Fee: USD 1,096,774
  Financing Requested: USD 14,000,000

Project Background and Context:

Afro and indigenous communities living in the border area between Colombia and Ecuador face high levels of malnutrition and insufficient food consumption. Climate change threatens the livelihoods and fragile food and nutrition security situation of these communities. Studies on the long-term impact of climate change in the border areas show threats related to increasing precipitation (13.7 percent increase in Nariño from 2011-2040), increasing temperatures (2-3°C increase in Esmeraldas over the century), rising sea levels, more frequent storm surges and ocean acidification. The proposed project seeks to link food security and livelihood resilience through climate change adaptation with the aims of the Binational Plan for border integration and peace building. Executed by local Afro and indigenous organizations in Carchi, Esmeraldas and Nariño, this project will promote community and ecosystem-based approaches and locally-generated climate change adaptation that develop institutional and community capacities in a culturally and conflict-sensitive manner. Thus, this project presents an important opportunity to integrate climate change adaptation into Afro and indigenous community development plans to promote a lasting peace.

Component 1: Increased Community Awareness and Knowledge (USD 1,893,800)

This component seeks to increase community awareness and knowledge on climate change and food and nutrition security related risks across the region. It is expected that this component will help raise community awareness of climate change risks and adaptation opportunities in support of the binational plan, peace building priorities and territorial development plans. Also, regional and binational climate analyses and studies will be conducted to inform planning and implementation of climate actions.

Component 2: Increased Institutional Adaptive Capacity (USD 2,650,400)

This component will seek to increase institutional adaptive capacity to address recurrent climate risks and build resilience in Afro and indigenous communities through the provision of innovative solutions. Capacities will be built to innovatively address climate threats through indigenous organizations such the Gran Familia del Pueblo Awá Binacional, in binational Afro- community councils and in local government. The expected results include the establishment of climate services, i.e. binational early warning systems, to manage local, national and regional risks in mangrove and paramo ecosystems in 140 communities. Also, Emergency Preparedness and Response (EPR) trainings will be conducted with regional community leaders and government officials in the target areas.
Component 3: Reduce recurrent risk of climate variability through an ecosystem approach in mangroves and paramos in Nariño, Esmeraldas and Carchi (USD 7,239,568)

Through this component, natural resources assets will be created, improved or maintained to ensure ecosystem resilience to the impacts of climate change across the region. The project will enhance ecosystem services including coastal protection and erosion control and water-provision from the paramos, and create, improve or maintain physical and natural assets at community level to build livelihood and ecosystem, considering food and nutrition security and mainstreaming gender, in 140 communities. It will also reduce crop losses of products such as cacao, banana, beans, corn and potatoes in 140 communities through the use of resistant seeds, improved land management and crop selection. Water management and control activities will be implemented by binational communities in 3,000 ha of paramos and 2,000 ha of mangroves in the Colombia-Ecuador border region, and land impacted by the conflict or threatened by climate change will be rehabilitated or recovered through tree planting. One binational platform will be developed to enable community to sharing traditional knowledge and best practice regarding adaptation to climate threats on food and nutrition security and gender.
Responses to observations made by the Adaptation Fund Board at its twenty-sixth meeting

WFP RESPONSE TO COMMENTS OF AF BOARD DECISIONS

<table>
<thead>
<tr>
<th>Adaptation Fund Board decisions (October 8-9, 2015)</th>
<th>WFP Response January 19, 2016</th>
</tr>
</thead>
<tbody>
<tr>
<td>Having considered the comments and recommendation of the Project and Programme Review Committee, the Adaptation Fund Board decided to:</td>
<td>In response to the comments by the PPRC and in consultation with the Ministries of the Environment in Colombia and Ecuador, WFP reformulated the Adaptation Fund Pre-Concept. WFP shifted its focus to populations in the border area between Colombia and Ecuador, particularly Afro and indigenous communities that are vulnerable to climate change and the impact of the 50-year conflict on fragile ecosystems. The border area is a priority region for both governments as stated in the Binational Plan for Border Integration 2014-2022, as this region is vulnerable not only to the armed conflict but to threats from climate change.</td>
</tr>
<tr>
<td>a) Not endorse the project pre-concept, as supplemented by the clarification response provided by the World Food Programme (WFP) to the request made by the technical review;</td>
<td></td>
</tr>
</tbody>
</table>
b) Suggest that WFP reformulate the proposal taking into account the observations in the review sheet annexed to the notification of the Board’s decision, as well as the following issues:

(i) The proposal should further demonstrate the relevance and the added value of the regional approach;

(ii) Upon justification of the regional approach, the proposed activities should be reformulated in order to achieve the regional objective, demonstrating innovation in the approach; and

c) Request WFP to transmit the observations under item (b) to the Governments of Colombia and Ecuador.

WFP will build added value through a regional approach by empowering Colombia and Ecuador to enact local climate change adaptation initiatives in border area ecosystems like mangroves and paramos and more effectively coordinate resources and efforts in case of natural disasters or conflict situations. Additionally, this project demonstrates the relevance of a regional approach by targeting communities like the Awa and the Pasto whose territories cross the border and who often migrate between Colombia and Ecuador.

The proposed activities achieve the regional objective through an innovative approach by: 1) leveraging climate services like Early Warning Systems and seasonal forecasts to inform community decision-making and ecosystem services to build community resilience to climate change; 2) considering traditional and local knowledge in implementing solutions for adaptation and environmental recovery; 3) focusing on marginalized communities that face substantial climatic threats as well as damage from the conflict; and 4) using climate change adaptation as a mechanism to promote confidence in the peace process and the post-conflict scenario. The project will integrate gender-responsive climate actions through: 1) training and awareness-raising for female and male participants on issues related to climate change and gender; 2) incorporating expert organizations in gender-related activities; and 3) focusing on adaptation and capacity-building of women and men. The logical framework and activities were reformulated accordingly.

<td>8. Is the project/programme submitted through an eligible Implementing Entity that has been accredited by the Board?</td>
<td>Yes.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Climate change threatens the livelihoods and fragile food and nutrition security situation of Afro and indigenous communities living in the border area between Colombia and Ecuador, which face high levels of malnutrition and insufficient food consumption. The project aims at reducing climate vulnerabilities of local Afro and indigenous communities and the ecosystems they depend on, promoting food and nutrition security and preventative capacities, and contributing to the construction of peace; and strengthening the adaptive capacities of local Afro and indigenous institutions to reduce the impact of climate threats.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The initial technical review found that although the proposed activities were concrete, the regional approach needed further demonstration, with some background information needed on the peace construction process between the two countries. Also, the pre-concept needed to demonstrate how innovative the proposed solution was. Lastly, the implementation arrangements and coordination mechanisms needed further clarification.

The revised pre-concept proposal has addressed the observations made by the technical review. However, at the concept document stage, it is expected that the proposal demonstrates an equitable involvement of local organisations from Ecuador in the implementation arrangements.

Date: 12 February 2016.
PART I: PROGRAMME PROJECT INFORMATION

Title of Programme: Improving the Resilience to Reduce the Impacts of Climate Change on Dryland Ecosystems for Food and Nutrition Security and Gender Equality.

Countries: Colombia and Ecuador
Thematic Focal Area: Food security
Type of Implementing Entity: Multilateral Implementing Entity (MIE)
Implementing Entity: United Nations World Food Programme (WFP)
Executing Entities: Ministries of Environment of Colombia and Ecuador
Amount of Financing Requested: 14,000,000 U.S. Dollars

Regional Background and Context:
The north western dry forest corridor expands from the northern Pacific Colombian coast to the southern Ecuadorian Pacific coast. Climate change and variability are already impacting these dry forest ecosystems in Colombia and Ecuador, and will continue to have medium and long term impacts, particularly on livelihoods and food security. Extreme weather events are disrupting harvest patterns, crop yields, livestock herds and water supplies and important ecosystem services. Within this regional ecosystem, La Guajira is among Colombia’s poorest and most climate-vulnerable departments, affected by long periods of drought (the current lasting 3 years), desertification processes and poor land use. In 2015, WFP consultants found that desertification threatens 92.2 percent of land in the department and the frequency and intensity of droughts is rising. Similarly in Manabí, Ecuador, the combination of rich biodiversity and endemism, fragile ecosystems, and prolonged annual droughts, extending on average 7-9 months, makes the province highly vulnerable to the impacts of climate change. According to the Second National Communication on Climate Change, Ecuador experienced an average temperature increase of 0.8°C during 1961-2006. In Colombia, projections consider that by 2100, the average temperature could rise by 2.3°C and rainfall could decrease by 40 percent compared to present rates.

In both departments, decreases in rainfall prevent Afro and indigenous communities from planting, contributing to in the Colombia-Ecuador border area
Countries: Colombia and Ecuador
Thematic Focal Area: Food security
Type of Implementing Entity: Multilateral Implementing Entity (MIE)
Implementing Entity: World Food Programme (WFP)
Executing Entities: Corponariño, Gran Familia del Pueblo Awá Binacional, La Corporación Red de Consejos Comunitarios del Pacifico Sur (RECOMPAS) and Autonomous Decentralized Governments (GAD)
Partners and Designated Authorities: Ministries of the Environment in Colombia and Ecuador
Amount of Financing Requested: 14,000,000 USD

Project Background and Context:
Afo and indigenous communities living in the border area between Colombia and Ecuador face high levels of acute malnutrition, overconsumption, and more pressure from fragile ecosystems to provide services. These effects are aggravated by poverty and inequalities, geographical location, topography, unequal distribution of resources and land-use practices. In La Guajira, In
Nariño, Colombia, chronic malnutrition in children under five is over 15 percent, compared to 13 percent nationally, and poverty reached 30 percent compared to 23.3 percent nationally in indigenous territories. In the same manner, Manabí, Ecuador reports high levels of chronic malnutrition in children under 5 years old (up to 58 percent compared to 25 percent nationally), and poverty (76.84 percent locally compared to 60 percent nationally). More than 50 percent of the population in both targeted departments depends on agriculture. The “El Niño” phenomenon five in the border area, with 17.7 percent in Esmeraldas and 32.7 percent in Carchi. The conflict compounds these effects, and in both countries insufficient rains, strong winds, and insufficient soil moisture have limited water, this fragile food and nutrition security situation, and major impacts on crops, soil quality, and people’s health. In the same manner, Manabí, Ecuador reports high levels of chronic malnutrition in children under 5 years old (up to 58 percent compared to 25 percent nationally), and poverty (76.84 percent locally compared to 60 percent nationally). More than 50 percent of the population in both targeted departments depends on agriculture. The “El Niño” phenomenon five in the border area, with 17.7 percent in Esmeraldas and 32.7 percent in Carchi. The conflict compounds these effects, and in both countries insufficient rains, strong winds, and insufficient soil moisture have limited water, this fragile food and nutrition security situation, and major impacts on crops, soil quality, and people’s health.

Climate change threatens the livelihoods and fragile food and nutrition security situation of these communities. Studies on the long-term impact of climate change in the border areas show threats related to increasing precipitation (13.7 percent increase in Nariño from 2011-2040), increasing temperatures (2-3°C increase in Esmeraldas over the century), rising sea levels, more frequent storm surges and ocean acidification. Along the Pacific Coast, increasing major impacts on crops, soil quality, and people’s health in this fragile food and nutrition security situation, and major impacts on crops, soil quality, and people’s health in this fragile food and nutrition security situation. Rising sea levels, increasing storm surges and ocean acidification will impact mangrove seedling establishment and destroy older stands, thus reducing system resilience and ability to provide vital ecosystem services to coastal and inland communities like aquaculture, protection from storm surges and erosion control. The long term increases in temperatures and rainfall in the paramos are projected to reduce the fragile biodiversity of this ecosystem, which is a critical water source for indigenous communities. The current El Niño phenomenon has resulted in drought and forest fires, limiting water access for human and animal consumption, decreased and decreasing crop production, contributed to disease and further degraded fragile natural resources in the border area. Climate events, compounded by El Niño, will likely increase the frequency of acute crop losses in the short term and food availability in the medium term. Climate change may impede progress in implementing the peace accord to be signed in March 2016 as increasing climate variability and severe events like El Niño reduce local incomes and increase the likelihood of conflict relapse.

In both countries, while women are important agents of change, with skills and knowledge on adaptation and reduction of risks, they are often excluded from decision-making regarding managing natural resources and risks. Climate change may impede progress in implementing the peace accord to be signed in March 2016 as increasing climate variability and severe events like El Niño reduce local incomes and increase the likelihood of conflict relapse.
Climate change adaptation provides opportunities to support the construction of peace and improve practices and structures to moderate potential damages from increasing climatic variability, which threatens important ecosystem services and disrupts harvest patterns and crop yields. This project proposes to implement climate change adaptation measures in the Colombia-Ecuador border area to build confidence in peace through empowering Afro and indigenous communities to invest in measures like climate services to strengthen food and nutrition security and prevent or minimize the impacts from climate events; 2) adapt to longer-term climate threats through community and institutional capacity building; and 3) restore vital ecosystem services and diversify livelihoods away from resource extraction. All will contribute to reversing the marginalization that these communities have faced for over 50 years, contributing to peace through adaptation to climate change.

Faced with the common challenges of peace-building, development and climate change in the border area, the governments of Colombia and Ecuador developed a Binational Plan for Border Integration. This plan sets forth initiatives on environment conservation, poverty, peace and economic integration. The proposed project would contribute to this binational framework by linking food security and livelihood resilience through climate change adaptation with the aims of the Binational Plan for border integration and peace building. Executed by local Afro and indigenous organizations in Carchi, Esmeraldas and Nariño, this project will promote community and ecosystem-based approaches and locally-generated climate change adaptation that develop institutional and community capacities in a culturally and conflict-sensitive manner. Thus, this project presents an important opportunity to integrate climate change adaptation into Afro and indigenous community development plans to promote a lasting peace.

**Project Objectives:**
1) Reduce climate vulnerabilities of local Afro and indigenous communities and the ecosystems they depend on, promoting food and nutrition security and preventative capacities, and contributing to the construction of peace; and 2) strengthen the adaptive capacities of local Afro and indigenous institutions to reduce the impact of climate threats.

**PART II: PROJECT JUSTIFICATION**

Climate and weather-related hazards in the border area, such as coastal storm surges, ocean acidification and droughts, lead not only to loss of life but also to livelihood resilience. This project innovatively addresses these challenges by: 1) leveraging climate services and ecosystem services to contribute to food and nutrition security; 2) implementing solutions for adaptation and environmental recovery considering traditional and local knowledge; 3) working with marginalized binational Afro and indigenous communities, which face substantial climate threats exacerbated by social and environmental damage from the prolonged conflict; and 4) using climate change adaptation as an approach for promoting confidence in the peace process. Climate services will include seasonal forecasts and Early Warning Systems, translated to local languages and adapted to local hazard risks. The information will be translated to local languages, adapted to local hazard risks and will be used in community decision making on adaptation planning. This project emphasizes traditional and local knowledge for ecosystem management because such knowledge has been used in government strategies for sustainable natural resource use, such as in mangrove conservation in Colombia. This project will be the first initiative to use knowledge from the Awá and the Pasto communities for environmental conservation and adaptation planning.

The governments of Colombia and Ecuador recognize the importance of territorial and differential approaches, especially in strengthening the role of Afro and indigenous communities within institutional frameworks on climate change adaptation. However, thus far these areas have not been sufficiently developed. Therefore, the
The proposed project supports WFP’s global mandate and the following strategic objectives: SO2 which supports food and nutrition security and rebuild livelihoods in fragile settings following emergencies; and SO3 which reduces risk and enables people, communities and countries to meet their own food and nutrition needs. Importantly, WFP has capacities in the proposed departments including sub-office presence in the targeted territory (Pasto, Tulcan, Esmeraldas and San Lorenzo). WFP has worked for over a decade with the targeted Afro and indigenous communities and is recognized for improving food and nutrition security in the area. The organization frequently works in sensitive situations and can access conflict-affected territories. Lastly, WFP has experience working with departmental governments and the Ministries of the Environment in Colombia and Ecuador, and on climate change adaptation projects in areas with fragile food and nutrition security.

Gender focus: In Afro and indigenous communities, women are particularly at risk due to gender inequality, gender-based violence and cultural barriers that affect their food and nutrition security. Gender inequality, as measured by UNDP’s Gender Inequality Index (2013), is 46.0 in Colombia and 42.9 in Ecuador, which are both above the South America’s average of 41.6. Climate change puts further strain on the already heavy workloads of women, impeding their ability to provide food for their families. Changes in precipitation patterns will hurt agricultural and small livestock production, usually domains of women. Reduced incomes and economic opportunities for women will negatively affect women’s autonomy and health, and their children’s health. Engrained cultural and gender roles require women to perform child-rearing, which means that climate change will impact children, increasing the risk of chronic malnutrition. Women’s traditional knowledge, including about their environment, supports the introduction of flexible adaptation strategies to buffer livelihoods against climate impacts and help improve food and nutrition security. The indigenous Wayuu, a matriarchal society, are particularly vulnerable to food and nutrition insecurity due to climate change and variability, threatening their livelihoods and traditional ways of life. Government figures show that one child under five died every week in 2014 from malnutrition related causes, the majority Wayuu.

Programme Objective: Identify dry ecosystem adaptation strategies and share experiences to increase resilience of households in the Colombian-Ecuadorian dry forest corridor, enabling the most vulnerable to withstand the negative impacts of climate change and variability. The regional approach will generate cost-efficient results and
Project Components and Result Areas:

1. Capacity Development and Institutional Strengthening: this component seeks to strengthen capacities at regional, national and local levels with the aim of managing risks and promoting local efforts in climate change adaptation. Food and nutrition security, gender equality, women’s empowerment, and cultural/ethnic sensitivity are key elements of the regional approach. Expected results include: a) awareness raised on climate change threats developed at community and regional level, including through the introduction of early warning systems, communities and local officials trained to identify and manage climate risks, implement innovative resilient production techniques and technologies for small producers, and link adaptation measures with food and nutrition security strategies; and, b) local development and food security plans and budgets, including territorial and indigenous development plans and policies, include climate change adaptation and risk management.

2. Knowledge Generation and Sharing: the regional approach will put particular attention to developing adaptation measures for dry ecosystems in specific social contexts of Colombia and Ecuador. These measures will be developed concurrently in the two countries providing the opportunity to learn by doing and to incorporate this learning in the targeted regions of both countries. Evidence generated, monitoring and impact evaluations will relate managing climate risks to support ecosystem provisioning in support of food and nutrition security, and gender equality at local and regional levels. Particular focus will be put on recovering and re-collecting traditional knowledge and practices to ensure sustainable agricultural and natural resource management. Concrete results will include: a) knowledge networks created for sharing lessons and best practices; b) climate data and project experiences systematized and made accessible for local decision making and public policy formulation; c) adequate integration of findings into country development plans, regional and national actions and communications on climate change, and discussions at the international level; and, d) links established between national and regional academic and public to promote discussions on climate risks, including from El Niño and the importance of strengthening climate services to manage individual, local, national and regional risks.

3. Adaptation and Resilience Measure to Reduce Climate-related Impacts and Strengthen Food and Nutrition Security: the regional approach will introduce measures to increase the resilience of vulnerable communities and the dry ecosystems upon which they depend, so they may better confront climate variability in the short and medium term. The Programme will support an integrated set of community-based (CbA) and ecosystem-based adaptation (EbA) interventions to reduce vulnerability and strengthen resilience, combining traditional knowledge and techniques with context-relevant technologies that help reinvent livelihoods. CbA, with gender and ethnic perspective, and EbA are both pivotal elements of the regional strategy, as decreasing climate threat levels to dry ecosystems and increasing their resilience will have a direct impact on the livelihoods of agriculture and herder families. Expected results include: a) ecosystem services enhanced including support services such as improved soil integrity and nutrient recycling through reforestation, soil management, conservation, and water retention; b) provisioning services in particular related to livestock and fodder production, increased yield through the adoption of resistant crops and seeds, better crop selection and plant breeding for drought tolerance, and water harvesting, conservation and storage; c) regulation services through erosion control and reduction of natural risks; d) technology transferred such as renewable energy technologies (wind and solar) and methods of advanced irrigation technologies (precision, sprinkle, gravity and drip irrigation, hydroponics); and, e) livelihoods strengthened through the provision of sustainable ecological services raised awareness, improved capacities, and ownership of concrete adaptation measures at the community level.

In addition to the above expected outcomes, adaptation output level results benefits from this programme include: a) physical and natural assets developed and technologies implemented in approximately 5 parishes in Manabí and 4 municipalities in La Guajira; b) approximately, 20,000 households benefit from the adoption of diversified, climate-resilient livelihood activities; c) risk and vulnerability assessments conducted at municipal level; d) at least 20,000 people participated in awareness raising action; e) 50 government officials and programme implementers trained to identify, plan, implement, and evaluate adaptation strategies; and, f) 1 regional platform strengthened to identify, prioritize and integrate adaptation strategies and measures.
The Governments of Colombia and Ecuador, and the two prioritized decentralized governments acknowledge the need for action to: 1) increase awareness of climate change threats; 2) generate more information and knowledge for adaptation planning to climate change threats at community level; 3) develop local adaptation plans, identifying community priorities and increase capacities to mitigate the impact of climate-related threats; and, 4) ensure that the poorest communities have the capacity to adapt to climate change impacts without further eroding their nutrition and food security and the integrity of the natural resources upon which they depend.

A significant contribution of the proposed regional approach is the emphasis on knowledge generation through the coordinated development of adaptation measures and technology transfer for dry ecosystems in parts of the Andean region that are already affected by climate change and the most recent El Niño phenomenon. Sharing and dissemination will be systematic and integrated in national and regional knowledge systems to promote replication of successful measures. By integrating relevant climate information into decision-making, strengthening capacity among entities to manage risks and develop cost-effective adaptation measures, a body of knowledge will become available. Sustainability of actions will be achieved through joint active participation of local communities and capacity strengthening of partners facilitating the gradual handover of responsibilities.

A coordinated regional programme, rather than two separate country interventions is more cost effective for a number of reasons. Since this project targets two areas that have a similar set of challenges, the set of solutions offered uses a common set of resources for e.g. one set of knowledge products, one common platform for knowledge sharing, a common monitoring system, technologies procured will benefit from economies of scale for one regional project rather than two disjoint national proposals. These exercises will directly feed into the efficiency of asset creation activities. It will avoid duplication which would occur if only a single country approach were implemented. As well, the regional approach will facilitate South-South cooperation and accelerate knowledge generation, dissemination and adoption within two countries of adaptation tools for dry ecosystems. The decentralized approach will strengthen existing relationships, structures and capacities of local institutions, and knowledge sharing will drive the exchange of best practices, methods and technologies between the countries. This regional project will generate savings on cost components related to producing research and analysis in the project areas. As a result, there is higher cost efficiency from coordinating and integrating technical, intellectual and economic resources in both countries. Finally the regional approach offers an initial scaling up of actions, reaching a greater number of participants, a larger reach within different contexts of the same ecosystem, and the foundation to replicate interventions in other regions.

Innovative aspects of the regional strategy include the aim to implement concrete climate change adaptation activities in vulnerable areas that share common threats, promoting the replication and scaling-up of cost-effective measures in vulnerable communities. The ecosystems approach seeks to ensure an innovative, efficient and sustainable response by building the resilience of ecosystem services and through climate services such as: forecasting climate impact on livelihoods by incorporating data on weather as well as agricultural yields, seasonal weather forecasting with food and nutrition security analysis. The focus on gender analysis at all stages is also innovative. Despite comprising more than half the population, women have not yet achieved equality in economic, social, political and cultural power structures of the two countries, especially in Colombia and Ecuador. In rural areas and indigenous communities, women have lower education levels, less access to credit, and less participation in government and decision-making mechanisms. This project is in accordance with the Lima Work Programme agreed during the COP 20 Parties of the Convention, this joint proposal is an active implementation of proactively integrating gender-responsive climate policy actions through: a) training and awareness-raising for female and male participants on issues related to gender balance and climate change and gender; b) incorporating expert organizations in gender-related activities; and, c) focusing on adaptation and capacity-building of women and men.

Additional Cost Reasoning: this programme is designed to increase the resilience and decrease the vulnerability of poor rural communities and their local institutions so they can better adapt to the negative impacts imposed by climate change. Assistance of the Adaptation Fund is sought to cover the additional costs necessary to strengthen and build institutional capacity on climate change issues (Outcome 1), implement concrete adaptation programs with vulnerable communities, and generate and disseminate knowledge (Outcome 2), and, execute tangible adaptation actions (Outcome 3).
Regional Focus: This programme integrates innovative processes to ensure sustainability, starting with ownership by local communities, support to decentralized governments and exchanges between two national governments. Special attention will be given to cost-sharing, the incorporation of adaptation actions in local development plans and budgets, and promoting the participation of regional entities such as CIAT and CIIFEN. As WFP already has established contacts with these regional institutes, they can play an important role in providing technical support, and promoting ownership of proposed actions in line with government priorities. In the region, CIAT has undertaken a major effort to develop and implement novel methods for generating information that can guide policies and decisions. This work includes the assessment of likely climate change impacts and of specific technological options such as drought-resistant seeds, climate-smart fodder and forage with the aim of informing national adaptation and mitigation plans. WFP, has worked since 2014 with CIIFEN (Centro Internacional para la Investigación del Fenómeno de El Niño) for the implementation and strengthening of an early warning system for Climate Change impact on food security in watersheds. In addition, within the region, WFP will look to strengthen coordination with national and regional institutions to promote the use of climate services systems to better prepare for disasters. This regional proposal is aligned with both government’s strategies to increase resilience and adaptation to climate change, and achieve food and nutrition security. Given Colombia’s high vulnerability and the absence of adaptation strategies in response to climate change, the National Plan of Climate Change Adaptation was created to reduce the vulnerability of the country and increase its ability to respond to climate threats and impacts. Food sovereignty and nutrition are integrated within national regulations and are part of national development strategies for both countries.

PART III: IMPLEMENTATION ARRANGEMENTS

WFP will focus on capacity development, coordination, facilitation, programme supervision and financial oversight. While implementation will be through local governments and NGOs in close coordination with national partners. The WFP Regional Bureaux will facilitate the regional approach, working with WFP Country Offices, supporting system development and knowledge networks, including the development of a sub-regional adaptation and food security platform. National government institutions will take full ownership of the programme, leading implementation at the national, provincial, municipal and community levels. Local governments will be part of the implementation of the programme in close coordination with provincial and national entities. National entities will be responsible for ensuring that the objectives and components of the programme are delivered effectively. WFP will seek technical advice from UN Women and NGOs to effectively mainstream gender, including a gender analysis, trainings on gender sensitive adaptation programming, and appropriate indicators to include in M&E processes. WFP will be responsible for developing M&E, ensuring implementation, and managing assigned resources. In order to avoid any institutional conflict or misunderstanding at regional, national or local levels, clear stakeholder roles will be defined. Regional, national, and local non-governmental, agricultural, and women’s organizations will be consulted throughout the programme to provide information and assistance at various stages.
### Programme

**Social and economic benefits for vulnerable groups:** This project targets marginalized and food insecure groups—Afro and indigenous communities and women. Gathering binational culturally and conflict sensitive information and using community participatory planning, this project will inform in a precise manner local adaptation as well as peace building, which are mutually reinforcing. Culturally-sensitive information is translated into local languages in an understandable manner depending on literacy levels. Conflict-sensitive information abides by the 'do no harm' principal. By rehabilitating environmentally threatened areas through an ecosystem-based approach, populations will have better access to productive lands and safe water. By improving their food and nutrition security and supporting a sustainable peace, this project will improve risk management and livelihood stability in the face of natural disasters and empower communities to cope with climate change. We will link central peace building strategies and rapid responses with local adaptation actions through community and ecosystem based adaptation.

**Project sustainability:** This project fits within the binational framework from the governments on the development of border areas and can transition to be overseen by the governmental institutions after the project is completed. The governments of Colombia and Ecuador prioritize decentralization and the role of departmental governments in peace construction and adaptation to climate change. As the capacities of local entities will be strengthened during project implementation, these entities can take over activities at the end of the activities.

### PART III: IMPLEMENTATION ARRANGEMENTS

WFP will serve as the Multilateral Implementing Entity (MIE) of this project and is responsible for all financial, monitoring and reporting responsibilities to the Adaptation Fund. It will additionally provide administrative and managerial support. The project will be implemented through WFP Country Offices in Colombia and Ecuador and additional guidance, technical support and fiduciary oversight will be provided by WFP’s Regional Bureau in Panama. The Ministries of the Environment in Colombia and Ecuador will provide technical guidance for project implementation under their policies and programmes. WFP will coordinate with the Ministries of Foreign Relations to ensure that the project falls within the binational agreement. Colombia’s Presidential Agency for International Cooperation will have a coordinating role and ensure that all appropriate entities are involved. Colombia’s Ministry of Post-Conflict will ensure that the project is implemented in a conflict-sensitive manner.

In Colombia and Ecuador, climate change adaptation trainings, risk awareness and planning activities, the collection and dissemination of traditional knowledge, and ecosystem service restoration activities like tree planting will be executed by local Afro and indigenous organizations, including the Gran Familia del Pueblo Awá Binacional, the Asociación de Autoridades Indígenas de Los Pastos, and Corporación Red de Consejos Comunitarios del Pacífico Sur (RECOMPAS), which are based in Colombia. These organizations are permanent autonomous umbrella associations of Afro and indigenous territorial authorities and have existing coordination mechanisms between communities in the two countries. Local disaster management authorities and local governments – Corponariño in Nariño and the Autonomous Decentralized Governments in Carchi and Esmeraldas - will assist in the development and implementation of the Early Warning Systems, seasonal forecasts, emergency preparedness and response trainings and the environmental impact assessments.

Technical assistance on climate information, mapping networks and the use of drought-resistant seeds and mangrove restoration will be provided by The International Center for Tropical Agriculture (CIAT) in Colombia, whose mandate involves improving human nutrition through agricultural research aimed at increasing the eco-efficiency of agriculture. Ecuador’s International Center for El Niño Research (CIIFEN) and the National Institute for Meteorology and Hydrology (INAMHI) will provide technical assistance on climate services, seasonal forecasts and climate risk assessments. UN Women will provide technical assistance on gender analyses, trainings and gender-sensitive adaptation programming. This project will strengthen coordination among Afro and indigenous institutions, with national and local government institutions, promoting adaptation, peace building initiatives, and the use of climate services systems to better prepare for disasters.

**Table Note:**
- Components are numbered in sequential order.
- Outcome indicators are specifically aligned with expected outputs.
- Countries listed correspond to specific regions or countries mentioned in the text.
2.2. Regional, national and local institutions

2.2.1. At least one yearly bi-national workshop and one regional study

2.2.2. Climate services established to manage local, national and regional risks, forecasts and trends in dry ecosystems established.

2.2.3. Monitoring system to track project results placed.

3.1. Increased adaptive capacity to manage risks and adapt to climate change in targeted rural communities increasing food and nutrition security with strong participation of women. 3.1.2. At least 240 communities benefitting from ecosystem services enhancement.

3.1.3. Reduced crop losses of products like cacao, banana, beans, corn and potatoes.

3.1.4. Change in crop selection.

3.1.5. % change in tree cover in conflict-affected lands.

3.1.6. # monitoring systems developed.

3.1.4. % change in community water storage mechanisms.

3.1.4. % reduction crop losses.

3.1.5. Lands impacted by the conflict or threatened by climate change rehabilitated, restored or maintained, through tree planting and sustainable management.

3.1.6. Monitoring system to track project results development and implementation.

3.1.7. At least 10 adaptation technologies identified and tested that strengthen resilience to climate threats on food and nutrition security.

3.1.8. % change in women’s experiences and participation.

3.1.9. # of adaptation measure; 240 assets created/restored.

3.1.10. % change in water management and control activities implemented by binational monitoring lines in 3,000 ha of paramos and 2,000 ha of mangroves in the Colombia-Ecuador border region.

3.1.11. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.12. % of communities affected by climate change rehabilitation.

3.1.13. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.14. % of communities affected by climate change rehabilitation.

3.1.15. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.16. % of communities affected by climate change rehabilitation.

3.1.17. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.18. % of communities affected by climate change rehabilitation.

3.1.19. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.20. % of communities affected by climate change rehabilitation.

3.1.21. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.22. % of communities affected by climate change rehabilitation.

3.1.23. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.24. % of communities affected by climate change rehabilitation.

3.1.25. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.26. % of communities affected by climate change rehabilitation.

3.1.27. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.28. % of communities affected by climate change rehabilitation.

3.1.29. # of conflict-affected communities benefiting from ecosystem service mechanisms.

3.1.30. % of communities affected by climate change rehabilitation.

3.1.31. # of conflict-affected communities benefiting from ecosystem service mechanisms.
