

ADAPTATION FUND

AFB/PPRC.19/28
26 September 2016

Adaptation Fund Board
Project and Programme Review Committee
Nineteenth meeting
Bonn, Germany, 4-5 October 2016

Agenda Item 8 f)

PROPOSAL FOR KYRGYZSTAN, TAJIKISTAN AND UZBEKISTAN

Background

1. The strategic priorities, policies and guidelines of the Adaptation Fund (the Fund), as well as its operational policies and guidelines include provisions for funding projects and programmes at the regional, i.e. transnational level. However, the Fund has thus far not funded such projects and programmes.

2. The Adaptation Fund Board (the Board), as well as its Project and Programme Review Committee (PPRC) and Ethics and Finance Committee (EFC) considered issues related to regional projects and programmes on a number of occasions between the Board's fourteenth and twenty-first meetings but the Board did not make decisions for the purpose of inviting proposals for such projects. Indeed, in its fourteenth meeting, the Board decided to:

- (c) Request the secretariat to send a letter to any accredited regional implementing entities informing them that they could present a country project/programme but not a regional project/programme until a decision had been taken by the Board, and that they would be provided with further information pursuant to that decision*

(Decision B.14/25 (c))

3. In its eighth meeting in March 2012, the PPRC came up with recommendations on certain definitions related to regional projects and programmes. However, as the subsequent seventeenth Board meeting took a different strategic approach to the overall question of regional projects and programmes, these PPRC recommendations were not included in a Board decision.

4. In its twenty-fourth meeting, the Board heard a presentation from the coordinator of the working group set up by decision B.17/20 and tasked with following up on the issue of regional projects and programmes. She circulated a recommendation prepared by the working group, for the consideration by the Board, and the Board decided:

- (a) To initiate steps to launch a pilot programme on regional projects and programmes, not to exceed US\$ 30 million;*
- (b) That the pilot programme on regional projects and programmes will be outside of the consideration of the 50 per cent cap on multilateral implementing entities (MIEs) and the country cap;*
- (c) That regional implementing entities (RIEs) and MIEs that partner with national implementing entities (NIEs) or other national institutions would be eligible for this pilot programme, and*
- (d) To request the secretariat to prepare for the consideration of the Board, before the twenty-fifth meeting of the Board or intersessionally, under the guidance of the working group set up under decision B.17/20, a proposal for such a pilot programme based on consultations with contributors, MIEs, RIEs, the Adaptation Committee, the Climate Technology Centre and Network (CTCN), the Least Developed Countries Expert Group (LEG), and other relevant bodies, as appropriate, and in that proposal make a recommendation on possible options*

on approaches, procedures and priority areas for the implementation of the pilot programme.

(Decision B.24/30)

5. The proposal requested under (d) of the decision above was prepared by the secretariat and submitted to the Board in its twenty-fifth meeting, and the Board decided to:

- (a) Approve the pilot programme on regional projects and programmes, as contained in document AFB/B.25/6/Rev.2;*
- (b) Set a cap of US\$ 30 million for the programme;*
- (c) Request the secretariat to issue a call for regional project and programme proposals for consideration by the Board in its twenty-sixth meeting; and*
- (d) Request the secretariat to continue discussions with the Climate Technology Center and Network (CTCN) towards operationalizing, during the implementation of the pilot programme on regional projects and programmes, the Synergy Option 2 on knowledge management proposed by CTCN and included in Annex III of the document AFB/B.25/6/Rev.2.*

(Decision B.25/28)

6. Based on the Board Decision B.25/28, the first call for regional project and programme proposals was issued and an invitation letter to eligible Parties to submit project and programme proposals to the Fund was sent out on 5 May 2015.

7. According to the Board Decision B.12/10, a project or programme proposal needs to be received by the secretariat no less than nine weeks before a Board meeting, in order to be considered by the Board in that meeting.

8. The following project concept document titled “Reducing vulnerabilities of populations in Central Asia region from glacier lake outburst floods in a changing climate” was submitted by the United Nations Educational, Scientific and Cultural Organization (UNESCO), which is a Multilateral Implementing Entity of the Adaptation Fund.

9. This is the third submission of the regional project pre-concept, however with a revised set of countries. It was submitted for consideration at the twenty-sixth meeting of the Board, covering Kazakhstan, Tajikistan and Uzbekistan. However, the proponent was not able to provide some of the required government endorsement letters, and the proposal had to be considered ineligible in accordance with the Operational Policies and Guidelines of the Fund. The proponent then resubmitted the pre-concept for consideration by the twenty-seventh meeting, with Kyrgyzstan, Tajikistan and Uzbekistan as the participating countries, and the Board decided to:

- (a) Endorse the project pre-concept, as supplemented by the clarification response provided by the United Nations Educational, Scientific and Cultural Organization (UNESCO) to the request made by the technical review; and*

(b) Encourage the Governments of Kyrgyzstan, Tajikistan and Uzbekistan to submit through UNESCO a project concept for the Board's consideration.

(Decision B.27/21)

10. The present submission was received by the secretariat in time to be considered in the twenty-eighth Board meeting. The secretariat carried out a technical review of the project proposal, with the diary number ASI/MIE/DRR/2015/1, and completed a review sheet.

11. In accordance with a request to the secretariat made by the Board in its 10th meeting, the secretariat shared this review sheet with UNESCO, and offered it the opportunity of providing responses before the review sheet was sent to the PPRC.

12. The secretariat is submitting to the PPRC the summary and, pursuant to decision B.17/15, the final technical review of the project, both prepared by the secretariat, along with the final submission of the proposal in the following section. In accordance with decision B.25/15, the proposal is submitted with changes between the initial submission and the revised version highlighted.

Project Summary

Kyrgyzstan, Tajikistan, Uzbekistan – Reducing vulnerabilities of populations in Central Asia region from glacier lake outburst floods in a changing climate

Implementing Entity: UNESCO

Project/Programme Execution Cost: US\$ 250,000

Total Project/Programme Cost: US\$ 4,575,000

Implementing Fee: US\$ 425,000

Financing Requested: US\$ 5,000,000

Project Background and Context:

The project has five “main objectives”: 1. To have the necessary comprehensive knowledge base established for adaptation planning, including scientific understanding of past and future lake formation and evolution, their relation to changes in the cryosphere, assessment of glacial lake outburst hazards, identification of populated areas vulnerable to flooding and assessment of the related risks; 2. To strengthen the capacities of responsible institutions and authorities to address immediate GLOF risks, and prepare for new threats that emerge as glaciers continue to retreat across Central Asia; 3. To develop and implement sustainable adaptation strategies, which directly engage and enable local communities to better understand and respond to GLOF risks, and thus adapt to climate change; 4. To implement pilot Early Warning Systems, which are fully embedded within the local institutional and societal contexts, and which serve as both a reference and motivation for similar climate change adaptation and DRR activities across the region; and 5. To have an opportunity and space for networking and exchange among practitioners from a range of disciplines, including Climate Change Adaptation and Disaster Risk Reduction, environment and development planning, provided to ensure enhanced knowledge sharing and strengthened capacities at the regional scale.

Component 1: Consolidating common knowledge and building capacities of responsible institutions/authorities to apply advanced methods and technologies in glacier lake monitoring and evolution (US\$ 550,000)

This project component is said to recognize that a comprehensive and successful adaptation project addressing water-related disasters must be built on a robust foundation of best available understanding of current and future glacier evolution, which is the basis of GLOF threats across Central Asia. In a first step, knowledge on past and future variations in essential climate variables (primarily changes in temperature and precipitation, and the response of glaciers and permafrost), which in turn influence development and susceptibility of glacial lakes, would be reviewed, compiled and improved. GLOF threats can develop rapidly, and affect large distances. Hence, first-order monitoring strategies are best implemented at the regional-scale, using remotely sensed imagery, supported with available long-term ground-based measurements, and modelling approaches. Furthermore, anticipation of where new lakes may develop as glaciers continue to retreat ensures adaptation strategies may be optimized for current, emerging, and future threats, and maladaptation can be avoided. Training of local responsible authorities in these methods and technologies would enable homogenous monitoring programs to be implemented across Central Asia. The capacity building program would be broadened to include training on the fundamentals of glaciers, lakes, and hazards within local educational institutions. While a common regional methodology framework would be applied, such training would be tailored to the local context of each country, and would help

ensure the long-term sustainability of the adaptation measures implemented under component 4.

Component 2: GLOF vulnerability and risk assessment and elaboration of policy recommendations for adaptation (US\$ 1,000,000)

This component is said to be framed by the concept of climate risk, endorsed by the Intergovernmental Panel on Climate Change in their latest assessment reports (Special Report on Managing the Risk of Extreme Events and the Fifth Assessment Report). The concept encourages a holistic approach, recognizing that climate related risk results from a physical event or hazard (e.g. GLOF) intercepting with an exposed and vulnerable system (e.g. community), with risk reduction strategies such as EWS seen as a key tool for climate change adaptation. There would be two scales to the risk assessment. Firstly, an assessment for all lakes and associated downstream affected land areas would be conducted at the regional scale. While a core assessment procedure would be homogenized, some physical, societal, and economic drivers of risk may vary between countries, such that approaches would be tailored for the local context. Secondly, based on the regional-scale assessment and consultation with local authorities, critical hot-spots of GLOF risk would be identified in each country. These hot-spots would be evaluated together with high-priority sites identified by local authorities, leading to local-scale assessments supported by field studies and validation at the most critical sites. This multi-level approach ensures that subsequent monitoring, preparedness, and EWS strategies are targeted to those lakes and downstream areas where risk of disaster is greatest.

Component 3: Elaboration of the EWS technologies, tailored to the local contexts to ensure long-term maintenance and sustainability (US\$ 800,000)

Early Warning is “the provision of timely and effective information, through identified institutions, that allows individuals exposed to hazard to take action to avoid or reduce their risk and prepare for effective response”. The importance and need to promote, invest in, develop, maintain and strengthen EWS is mentioned several times in Sendai Framework. In Component 3 the institutional mechanisms would be evaluated and established if needed, and EWS concepts would be elaborated for the study sites in each country as defined by the needs of the Governments and based on the findings from Component 2.

Component 4: Targeted demonstration project to introduce technologies and best practices for EWS for glacier lakes technologies (US\$ 1,275,000)

Based on the recommendation of the local authorities, and the results of the largescale hazard and risk assessment (component 2), this component would implement one early-warning system tailored to the requirements of each participating country. In addition to implementing the EWS, this component would include developing a maintenance and financing strategy for ensuring its long-term sustainability, and training and drilling authorities and local population through simulation exercises.

Component 5: Establishing synergies and synchronizing knowledge exchange, stakeholder engagement and communication activities (US\$ 700,000, all three countries)

This component would oversee the development and implementation of knowledge management, exchange, stakeholder engagement and communication activities arising out of components 1 - 4. The primary goal of this component would be to ensure that these activities are harmonized across the region, through joint meeting and workshop organization, design of

common products (e.g. web knowledge platform) and shared resources (e.g. guidelines, policy briefs, and educational materials). In this manner, implementation of activities would be cost-effective and duplication of efforts can be avoided. Activities conducted under this component must draw on the strengths and diversity of the regional program, while being sensitive to local and site-specific requirements, thereby providing the foundation for successful and sustainable adaptation interventions.

ADAPTATION FUND

ADAPTATION FUND BOARD SECRETARIAT TECHNICAL REVIEW OF PROJECT/PROGRAMME PROPOSAL

PROJECT/PROGRAMME CATEGORY: Regional Project Concept

Countries/Region: **Kyrgyzstan, Tajikistan, Uzbekistan**
 Project Title: **Reducing vulnerabilities of populations in Central Asia region from glacier lake outburst floods in a changing climate**
 Thematic Focal Area: **Disaster risk reduction and early warning systems**
 Implementing Entity: **United Nations Educational, Scientific, and Cultural Organization (UNESCO)**
 Executing Entities: **National entities countries in charge of Disaster Risk Reduction**
 AF Project ID: **ASI/MIE/DRR/2015/1**
 IE Project ID: Requested Financing from Adaptation Fund (US Dollars): **5,000,000**
 Reviewer and contact person: **Mikko Ollikainen** Co-reviewer(s): **Daouda Ndiaye**
 IE Contact Person: **Kristine Tovmasyan**

Review Criteria	Questions	Comments on 22 August 2016	Comments on 12 September 2016
Country Eligibility	1. Are all of the participating countries party to the Kyoto Protocol?	Yes.	
	2. Are all of the participating countries developing countries particularly vulnerable to the adverse effects of climate change?	Yes.	
Project Eligibility	1. Has the designated government authority for the Adaptation Fund endorsed the	No. The proposal has been submitted with an endorsement letter from the Designated Authority for Uzbekistan. The endorsement letters from the other countries are missing.	

	project/programme?	CAR1: Please submit an endorsement letter for the project from the Designated Authorities for Kyrgyzstan and Tajikistan.	CAR1: Addressed.
	2. Does the regional project / programme support concrete adaptation actions to assist the participating countries in addressing the adverse effects of climate change and build in climate resilience, and do so providing added value through the regional approach, compared to implementing similar activities in each country individually?	<p>Requires clarification. Overall comment: the information contained in the project background and context section is scant and does not provide a comprehensive analysis of the problems the project aims to solve, and the context in which the project is planned to operate.</p> <p>CR1: Please provide a more comprehensive problem analysis of the adaptation challenge the project would aim to address, including the gaps/bottlenecks that have prevented implementation of the proposed activities, and why this project would be needed to overcome those gaps/bottlenecks.</p> <p>CR2: In the background section, please provide further contextual information of the planned locations of the project, including their populations, livelihoods and other factors that have an impact on their resilience.</p> <p>It is not possible to conclusively assess to which extent the project would include concrete adaptation investments as required by the Adaptation Fund mandate. In places, the proposal uses terminology reminiscent of research projects, e.g. “study sites”, while the focus on the direct impact of the project on stakeholders such as communities at risk of GLOFs, is very limited. Majority of</p>	<p>CR1: The additional information is limited and does not comprehensively clarify the gaps or bottlenecks planned to be addressed by the project.</p> <p>CR2: Not sufficiently addressed. Only suggested locations have been named but the characteristics of those locations have not been provided.</p>

		<p>the project appears to be directed towards studies, assessments, plans and knowledge management, while only on Component (4) would clearly involve implementation of Early Warning System (EWS). The proposed budget for Component 4 represents less than 30 per cent of the component budgets.</p> <p>CR3: Please reconsider and, if necessary, revise the focus of the project on concrete vs. non-concrete activities.</p>	<p>CR3: Not addressed. The concept cannot be confidently considered to represent concrete adaptation.</p>
	<p>3. Does the project / programme provide economic, social and environmental benefits, particularly to vulnerable communities, including gender considerations, while avoiding or mitigating negative impacts, in compliance with the Environmental and Social Policy of the Fund?</p>	<p>Unclear. The presentation of the proposal focuses on the technical solution, and as noted above does not elaborate how it would yield different benefits for vulnerable communities.</p> <p>CR4: Following reconsideration of the project focus, please outline the expected beneficiaries of the project with particular reference to the equitable distribution of benefits to vulnerable communities, households, and individuals.</p> <p>CR5: Please provide a tabular presentation of the economic, social and environmental benefits the project would yield, particularly to vulnerable communities, including gender considerations.</p>	<p>CR4: Not addressed.</p> <p>CR5: Partly addressed. A table on economic, social and environmental benefits of the project is included. However, as information on the context and locations is very limited as noted above, the listed benefits mostly represent benefits of GLOF projects in general, not of this specific project.</p>
	<p>4. Is the project / programme cost-effective and does the regional approach support cost-effectiveness?</p>	<p>The proposal has referenced certain features that support cost-effectiveness, such as enabling replication using the regional approach. However, as noted above, the proposal is currently focused on non-concrete activities, and overall impact of the project on vulnerable</p>	

		<p>communities is unclear.</p> <p>In different parts of the proposal, references are made on planned collaboration with Swiss partners, including the Universities of Zurich and Fribourg, however, it is not clear what the nature of this collaboration would be, and whether project funds are planned to be allocated for these organizations.</p> <p>CR6: Please clarify the role, both operationally and financially, that the Swiss partners are planned to have in the proposed project.</p>	<p>CR6: A response has been given, however, it raises new questions. According to the response, UNESCO would “sub-contract” these universities to work on the project. It is not clear whether these universities would then represent executing entities (they have not been listed as such) or whether they would report to executing entities. If the proposal were to proceed to a fully-developed stage, it would also need to clarify whether this would be in compliance with UNESCO’s procurement policies and if so, what the added value of single-sourcing such universities would be.</p>
	<p>5. Is the project / programme consistent with national or sub-national sustainable development strategies, national or sub-national development plans, poverty reduction strategies, national communications and adaptation programs of action and other relevant instruments? If applicable, it is also possible to refer to regional plans and strategies where</p>	<p>Yes, broadly.</p>	

	they exist.		
	6. Does the project / programme meet the relevant national technical standards, where applicable, in compliance with the Environmental and Social Policy of the Fund?	<p>The proposal states that the EWS would build on international standards. The proposal is silent on whether it would comply with national standards.</p> <p>CR7: Please identify applicable national standards and explain whether the project would comply with those standards.</p>	CR7: Addressed considering the currently described scope of the project.
	7. Is there duplication of project / programme with other funding sources?	<p>The proposal presents an argument that it will be the only regional initiative addressing GLOFs, at least in the same size category. However, it is not clear whether there are country-specific activities, either funded by the governments of those countries or externally, addressing GLOF risks in the proposed beneficiary countries, apart from one project in Tajikistan (FOCUS).</p> <p>CR8: Please elaborate on the recent or on-going GLOF-related activities in the target countries.</p>	CR8: Not addressed. The response sheet submitted together with the revised proposal makes a reference to a comprehensive analysis of existing DRR activities in the countries and states that risk of duplication is negligible. However, this statement has not been substantiated in the project proposal
	8. Does the project / programme have a learning and knowledge management component to capture and feedback lessons?	Yes.	

	9. Has a consultative process taken place, and has it involved all key stakeholders, and vulnerable groups, including gender considerations?	An initial consultative process has taken place but, reflecting the current focus of the project, it seems it has practically not involved the vulnerable communities of the target countries. CR9: Please explain whether community-level consultations have taken place. If not, following reconsideration of the project focus, please consider undertaking such consultations, to inform the project on community needs and preferences.	CR9: Not addressed. No community-level consultations have taken place.
	10. Is the requested financing justified on the basis of full cost of adaptation reasoning?	In general, yes. However, this section should be revisited following the reconsideration of the focus of the project mentioned above.	
	11. Is the project / program aligned with AF's results framework?	Yes, broadly.	
	12. Has the sustainability of the project/programme outcomes been taken into account when designing the project?	To certain extent, yes. However, it appears contradictory that while the proposal notes that local populations' "involvement from the beginning is critical" for social sustainability, the consultative process of developing the proposal appears not to have involved consultations with communities, as observed above. In addition, the proposal states, on institutional sustainability, that "financial and personnel resources need to be planned and secured in the budgets of the local or national institutions". However, it has not been elaborated how	

		<p>this would be done.</p> <p>CR10: Please briefly explain how financial and personnel resources for the sustainability of the proposed project activities would be secured in the budgets of the local and national institutions.</p>	<p>CR10: Not adequately addressed. The response sheet submitted together with the revised proposal has explained sustainability as a result of participation and involvement but it has not been addressed how resources would be secured.</p>
	<p>13. Does the project / programme provide an overview of environmental and social impacts / risks identified?</p>	<p>Not sufficiently. The proposal has filled in the environmental and social risk screening matrix but the statements made in the matrix is scant and is not well anchored in the project design. For example, the proposal states that the project would not exacerbate existing inequalities but it does not provide information on how it would achieve this. As another example, the matrix states that marginalized groups would be strongly involved but the proposal does not state how.</p> <p>CR11: Please provide further information on environmental and social impacts and risks in the proposed project. Please also ensure that information related to these risks and their mitigation measures is consistent with the description of project activities.</p> <p>The proposal has assigned the project environmental and social risk category C but this has not been substantiated, as the project at the same time has been acknowledged to involve certain risks that are planned to be addressed.</p> <p>CR12: Please reconsider and risk categorization of the project and clarify</p>	<p>CR11: Not adequately addressed. The proposal section on environmental and social risk screening continues to be somewhat superficial, making short unsubstantiated statements. All in all, the project background and activities would need to be better known, and informed by a better understanding of community characteristics and preferences, before a meaningful risk screening as required at the concept stage could be carried out.</p>

		rationale.	CR12: Addressed. The project is now categorized as B.
	14. Does the project promote new and innovative solutions to climate change adaptation, such as new approaches, technologies and mechanisms?	The proposed project has some innovative elements, such as GLOF EWS and regional cooperation.	
Resource Availability	1. Is the requested project / programme funding within the funding windows of the pilot programme for regional projects/programmes?	Yes.	
	2. Are the administrative costs (Implementing Entity Management Fee and Project/ Programme Execution Costs) at or below 20 per cent of the total project/programme budget?	Yes.	
Eligibility of IE	3. Is the project/programme submitted through an eligible Multilateral or Regional	Yes.	

	Implementing Entity that has been accredited by the Board?		
Implementation Arrangements	1. Is there adequate arrangement for project / programme management at the regional and national level, including coordination arrangements within countries and among them? Has the potential to partner with national institutions, and when possible, national implementing entities (NIEs), been considered, and included in the management arrangements?	n/a (Not applicable at the concept stage.)	
	2. Are there measures for financial and project/programme risk management?	n/a (Not applicable at the concept stage.)	
	3. Are there measures in place for the management of for environmental and social risks, in line with the	n/a (Not applicable at the concept stage.)	

	Environmental and Social Policy of the Fund? Proponents are encouraged to refer to the Guidance document for Implementing Entities on compliance with the Adaptation Fund Environmental and Social Policy, for details.		
	4. Is a budget on the Implementing Entity Management Fee use included?	n/a (Not applicable at the concept stage.)	
	5. Is an explanation and a breakdown of the execution costs included?	n/a (Not applicable at the concept stage.)	
	6. Is a detailed budget including budget notes included?	n/a (Not applicable at the concept stage.)	
	7. Are arrangements for monitoring and evaluation clearly defined, including budgeted M&E plans and sex-disaggregated data, targets and indicators?	n/a (Not applicable at the concept stage.)	
	8. Does the M&E Framework include a break-down of	n/a (Not applicable at the concept stage.)	

	how implementing entity IE fees will be utilized in the supervision of the M&E function?		
	9. Does the project/programme's results framework align with the AF's results framework? Does it include at least one core outcome indicator from the Fund's results framework?	n/a (Not applicable at the concept stage.)	
	10. Is a disbursement schedule with time-bound milestones included?	n/a (Not applicable at the concept stage.)	

Technical Summary	<p>The project would aim to strengthen adaptation to climate change in Central Asia by reducing societal risks and vulnerabilities associated with Glacier Lake Outburst Floods (GLOFs). This would be achieved through strengthening the monitoring, analytical and response capacities of institutions and government officials responsible for disaster risk reduction (DRR) and emergencies, through community and gender-sensitive ground-level training and awareness campaigns, and through the establishment of early warning systems (EWS), supported with the necessary state-of-the-art monitoring strategies.</p> <p>The initial technical review finds that the proposal appears to present a knowledge-oriented project with relatively little investment planned on concrete adaptation measures on the ground. Therefore, it is not clear whether the project would be in line with the Adaptation Fund mandate to finance concrete adaptation projects. The following corrective action requests (CAR) and clarification requests (CR) are made:</p> <p>CAR1: Please submit an endorsement letter for the project from the Designated Authorities for Kyrgyzstan and Tajikistan.</p> <p>CR1: Please provide a more comprehensive problem analysis of the adaptation challenge the project would aim to address, including the gaps/bottlenecks that have prevented implementation of the proposed activities, and why this project would be needed to overcome those gaps/ bottlenecks.</p> <p>CR2: In the background section, please provide further contextual information of the planned locations of the</p>
-------------------	--

	<p>project, including their populations, livelihoods and other factors that have an impact on their resilience.</p> <p>CR3: Please reconsider and, if necessary, revise the focus of the project on concrete vs. non-concrete activities.</p> <p>CR4: Following reconsideration of the project focus, please outline the expected beneficiaries of the project with particular reference to the equitable distribution of benefits to vulnerable communities, households, and individuals.</p> <p>CR5: Please provide a tabular presentation of the economic, social and environmental benefits the project would yield, particularly to vulnerable communities, including gender considerations.</p> <p>CR6: Please clarify the role, both operationally and financially, that the Swiss partners are planned to have in the proposed project.</p> <p>CR7: Please identify applicable national standards and explain whether the project would comply with those standards.</p> <p>CR8: Please elaborate on the recent or on-going GLOF-related activities in the target countries.</p> <p>CR9: Please explain whether community-level consultations have taken place. If not, following reconsideration of the project focus, please consider undertaking such consultations, to inform the project on community needs and preferences.</p> <p>CR10: Please briefly explain how financial and personnel resources for the sustainability of the proposed project activities would be secured in the budgets of the local and national institutions.</p> <p>CR11: Please provide further information on environmental and social impacts and risks in the proposed project. Please also ensure that information related to these risks and their mitigation measures is consistent with the description of project activities.</p> <p>CR12: Please reconsider and risk categorization of the project and clarify rationale.</p> <p>The final technical review of the proposed project finds that while some of the issues raised in the initial review have been addressed, others still remain:</p> <ul style="list-style-type: none"> - The proposal should better describe the characteristics of the project sites, and the gaps and bottlenecks that it would hope to address, how it would represent concrete adaptation, and how it would bring about economic, social and environmental benefits. This would also enable better screening of environmental and social risks. - The proposal should clarify the planned execution arrangements, including the use of European universities as preselected subcontractors. - The proposal should elaborate on the recent or on-going GLOF-related activities in the target countries. - The proposal should elaborate on the sustainability from the financial perspective. - Even for the concept-level proposal, community consultations should take place and inform the project design and risk consideration.
Date:	12 September 2016

REGIONAL PROJECT/PROGRAMME PROPOSAL

PART I: PROJECT/PROGRAMME INFORMATION

Title of Project/Programme:	Reducing vulnerabilities of populations in the Central Asia region from glacier lake outburst floods in a changing climate
Countries:	Kyrgyzstan, Tajikistan, Uzbekistan
Thematic Focal Area ¹ :	Disaster risk reduction and early warning systems
Type of Implementing Entity:	MIE
Implementing Entity:	UNESCO
Executing Entities:	National entities in charge of Disaster Risk Reduction in the countries
Amount of Financing Requested:	5,000,000 (in US\$ Equivalent)

Project / Programme Background and Context:

Provide brief information on the problem the proposed project/programme is aiming to solve, including both the regional and the country perspective. Outline the economic, social, development and environmental context in which the project would operate in those countries.

Central Asia is facing important challenges to cope with adverse effects of climate change. In particular, the impacts of climate change on water-related disasters in the region have been recognised as a key threat². The Central Asian (CA) states socio-economically disadvantaged, indigenous groups, ethnic minorities, women, children and elderly are highly sensitive and particularly vulnerable to the impacts of climate change, as resilience and coping capacities are typically low. A most pronounced effect of global warming in CA is the melting of glaciers and associated formation of glacial lakes. Since about 1950, between 14% and 30% of the Tien Shan and Pamir glaciers have melted. Today's rate of glacier loss in CA is 0.2–1% per year in volume. Due to glacier melting and lake formation, there is an increased danger of Glacier Lake Outburst Floods (GLOFs), which confound and exacerbate the water-related threat to mountain communities, their settlements, livelihood, and infrastructure located on river floodplain areas. The number of glacial lakes and incidences of failure has been increasing

¹ Thematic areas are: Food security; Disaster risk reduction and early warning systems; Transboundary water management; Innovation in adaptation finance.

² The declaration of the International conference on water-related natural disaster reduction, held in 2008 in Dushanbe, stated that research on the impacts of climate variability and change on water related disasters should be increased, in particular with the aim to develop adaptation strategies and mitigation measures. Water scarcity coupled with climate change related disasters has been recognized as a critical challenge in Central Asia region during the high level international conference on the implementation of the "Water for Life" decade, held in Dushanbe, Tajikistan in June 2015.

globally over the last 40 years, and this threat is expected to further increase as new lakes continue to develop and surrounding steep slope destabilize in response to warming. Events may be far-reaching with significant downstream environmental, economical, and ultimately societal consequences. Hence, the increasing risk of disasters from GLOFs is a significant threat to national and regional security, and sustainable development in Central Asia.

Formatted

Formatted: Right: 0.08"

The GLOF in the Shakhimardan River catchment in Uzbekistan, for example, resulted in 93 fatalities in 1998, and the GLOF in Dasht, Tajikistan in 2002 left behind dozens of people dead, and the Zyndan glacial lake led to substantial economic losses in 2009. High temperatures and the rapid melting of snow and glacier ice in July 2015 triggered mudflows in the mountainous regions of Tajikistan. Meltwater outbursts from the Aksai glacier in northern Kyrgyzstan triggered a GLOF as a result of which houses and road infrastructure in villages down the valley have been damaged and the lake still poses a continuous threat to the capital city Bishkek. According to the latest inventory, there are more than 350 glacial lakes in Kyrgyzstan in danger of outburst. Each year, there are twenty lakes that are in acute danger of failure. Approximately 300 settlements are exposed to potential GLOFs. The complex topography of Tajikistan, its high rainfall levels and large number of glaciers mean that Tajikistan is highly exposed to flood hazards, largely caused by GLOFs, which store huge volumes of water behind unstable natural barriers. The south-western Pamir mountain range in Tajikistan contains around 335 lakes with GLOF potential. Very large floods and mudslides in Uzbekistan are generally caused by the outbreak of mountain lakes. According to Uzbekistan Hydromet, the country is threatened with 271 potential GLOFs, most of which are located outside its border. Regional scientific studies suggest that glacier shrinkage is causing more frequent glacier hazards, including GLOFs. Besides owing a large volume of water released by GLOFs, they present a significant transboundary hazard.

In the CA region, which was part of the Soviet Union, disaster response was traditionally stronger than prevention and preparedness, and in the government structure relevant ministries/committees were responsible for disaster response. With today's new priorities and national strategies, the issue of monitoring, forecasting and early warning of natural hazards (including on GLOFs) are gaining importance in the region, although preventive measures are as yet still lacking. Resources from AF funds are required for the following reasons:

- Due to the limited information on the expected distribution and impact of GLOFs in a changing climate, there are no capacities to manage effectively the risks posed by GLOFs, including issuing EWS on them.
- The institutions are very weakly equipped with modern technologies for EWS; some monitoring on lakes exists but there is no comprehensive system as such in any of the countries, nor any risk analysis on populations affected by GLOFs.
- No regional cooperation exists for assessment and monitoring of transboundary GLOFs; exchange of information and transmitting of early warnings is not available.

- There are no mechanisms available among disaster experts, managers and planners to develop local risk reduction plans from GLOFs. The institutions work in isolation.
- There is no cooperation between the scientific community, practitioners and stakeholders in the field of disaster risk reduction, including on GLOFs.
- No access and opportunities for adequate education and training on GLOFs exist at community level, especially for vulnerable groups in remote communities.

Besides, it should be pointed out, that since many of the glacier lakes in Central Asia are of a transboundary nature, there is a strong need for regional cooperation in addressing GLOFs, and first and foremost it is establishing of regional cooperation in GLOF hazard monitoring and analysis, as well as early warning. Taking into account the political context of the region, the project provides an excellent platform for regional cooperation on enhancing resilience of population from GLOFs with contribution towards dialogue among countries, thus also to peace and security in Central Asia.

Communities in GLOF-prone mountain valleys need to be better educated on GLOF threats. They will be involved in risk management and prevention activities, as community-based implementation of targeted risk reduction activities are planned to be pursued. The project will have a positive effect not only on resilience of communities, but will also link these usually isolated groups with DRR stakeholders at national level, thus contributing to their broader economic and social development.

Building resilience and reducing societal vulnerabilities to climate related disasters is clearly recognized as a key requirement for sustainable development. In fact, the United Nations 2030 Agenda for Sustainable Development specifically pledges to reduce physical and economic losses caused from water-related disasters, with a focus on the most vulnerable communities, and furthermore highlights the need for improved education, awareness-raising, and capacity building in relation to climate change impacts and early warning (2030 Agenda targets 11.5 and 13.3). These are themes targeted specifically within this project design, and are in line also with requirements identified from various stakeholder events held in CA.

The project aims to strengthen adaptation to climate change in Central Asia by reducing societal risks and vulnerabilities associated with GLOFs. ~~This~~ This is achieved through strengthening the monitoring, analytical and response capacities of institutions and government officials responsible for disaster risk reduction (DRR) and emergencies, through community and gender-sensitive ground-level training and awareness campaigns, and through the establishment of early warning systems (EWS), supported with the necessary state-of-the-art monitoring strategies. The emerging and increasing risk ~~-associated -with -GLOFs, -together -with -appropriate -response -and -adaptation~~

Project / Programme Objectives:

List the main objectives of the project/programme.

The main objectives of the project are as follows:

1. To have the necessary comprehensive knowledge base established for adaptation planning, including scientific understanding of past and future lake formation and evolution, their relation to changes in the cryosphere, assessment of glacial lake outburst hazards, identification of populated areas vulnerable to flooding and assessment of the related risks.
2. To strengthen the capacities of responsible institutions and authorities to address immediate GLOF risks, and prepare for new threats that emerge as glaciers continue to retreat across Central Asia.
3. To develop and implement sustainable adaptation strategies, which directly engage and enable local communities to better understand and respond to GLOF risks, and thus adapt to climate change.
4. To implement pilot Early Warning Systems, which are fully embedded within the local institutional and societal contexts, and which serve as both a reference and motivation for similar climate change adaptation (CCA) and DRR activities across the region.
5. To have an opportunity and space for networking and exchange among practitioners from a range of disciplines, including Climate Change Adaptation and Disaster Risk Reduction, environment and development planning, provided to ensure enhanced knowledge sharing and strengthened capacities at the regional scale.

PART II: PROJECT / PROGRAMME JUSTIFICATION

- A. Describe the project / programme components, particularly focusing on the concrete adaptation activities, how these activities would contribute to climate resilience, and how they would build added value through the regional approach, compared to implementing similar activities in each country individually. For the case of a programme, show how the combination of individual projects would contribute to the overall increase in resilience.

Formatted: Justified, Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted

This project will reduce climate change induced risks and vulnerabilities from GLOFs in Central Asia by implementing science and community-embedded adaptation measures. More broadly, the project will build societal awareness and thereby resilience to the threat of climate change, and particularly water-related disasters. Adaptation measures, including EWS, are strongly promoted by the Sendai Framework of Disaster Risk Reduction 2015-2030, to which CA countries are committed. According to the United Nations Office for Disaster Risk Reduction (UNISDR) the following are four key elements of EWS: I. risk knowledge; II. monitoring and warning service; III. dissemination and communication; and IV. response capability. The components of the projects are designed to address these four key elements, as described below.

Formatted

A core strength of this project is the focus on **regional implementation** of adaptation activities. This is crucial, as GLOFs represent far-reaching climate driven disasters, that may originate in remote regions, and cause damage considerable distances (hundreds of kilometres) downstream. Examples of far-reaching GLOF disasters have already occurred in Central Asia (e.g., 1998 outburst event from the Archa-Bashy glacier in Kyrgyzstan, with resulting devastation in Uzbekistan), and are a major threat throughout high mountains in Asia. In fact, during the international seminar co-organized by the UN Regional Centre for Preventive Diplomacy in Central Asia and UNESCO, "The Impact of Glaciers Melting in Central Asia on National and Trans-Boundary Water Systems" in Almaty, Kazakhstan, April 2013,

Formatted: Right: 1"

Formatted

GLOFs were specifically highlighted as a key threat to the socio-economic development of the region. Therefore, this project emphasizes the development of common monitoring, assessment, and response strategies, while also recognizing that final implementation must be tailored to local physical, cultural and societal contexts. The project will facilitate several regional exchange workshops, enabling experiences and knowledge to be shared and transferred between partners, while the implementation of three distinct pilot demonstration projects will provide a basis for comparative evaluation, identifying successes and lessons learnt between countries.

Formatted

The need for improved **capacity building** related to climate change impacts and adaptation was highlighted in the 2030 Agenda under SDG 13, target 13.1 and therefore education, awareness raising, and strengthening of human and institutional capacities forms a central thread to all components of this project proposal. International experience has demonstrated that early engagement of a wide-range of men and women stakeholders (from the community through to government authorities) leads to local acceptance, ownership, and ultimately successful adaptation interventions. Overall synchronization of the stakeholder engagement and capacity building activities in this project will be achieved under component 5, based on outputs generated within components 1 - 4. Such capacity building at multiple levels will ensure that the countries are well equipped and motivated to maintain long-term, sustainable adaptation strategies implemented under this project.

Formatted

Component 1: Consolidating common knowledge and building capacities of responsible institutions/authorities to apply advanced methods and technologies in glacier lake monitoring and evolution.

Formatted: Expanded by 2.55 pt

Formatted: Heading 3, Right: 0.09"

Formatted: Not Expanded by / Condensed by

This project component recognizes that a comprehensive and successful adaptation project addressing water-related disasters must be built on a robust foundation of best available understanding of current and future glacier evolution, which is the basis of GLOF threats across Central Asia. In a first step, knowledge on past and future variations in essential climate variables (primarily changes in temperature and precipitation, and the response of glaciers and permafrost), which in turn influence development and susceptibility of glacial lakes, will be reviewed, compiled and improved. GLOF threats can develop rapidly, and affect large distances. Hence, first-order monitoring strategies are best implemented at the regional-scale, using remotely sensed imagery, supported with available long-term ground-based measurements, and modelling approaches. Furthermore, anticipation of where new lakes may develop as glaciers continue to retreat ensures adaptation strategies may be optimized for current, emerging, and future threats, and maladaptation can be avoided. Training of local responsible authorities in these methods and technologies will enable homogenous monitoring programs to be implemented across Central Asia. The capacity building program will be broadened to include training on the fundamentals of glaciers, lakes, and hazards within local educational institutions. While a common regional methodology framework will be applied, such training will

Formatted

be tailored to the local context of each country, and will help ensure the long-term sustainability of the adaptation measures implemented under component 4.

Formatted

Formatted: Right: 0.09"

Component 1 will encompass the following Outputs and indicative activities:

Output 1.1: Glacier lake monitoring and forward-looking programmes designed and tailored for each country:

Formatted: Expanded by 2.65 pt

Formatted: Right: 0.09"

Indicative activities under Output 1.1 will include:

Formatted: Condensed by 0.05 pt

1.1.1. Review and assessment of observed and projected changes in essential climate variables across Central Asia, providing context and basis for design of the lake monitoring programs, and establishing synergies with ongoing and future regional cryosphere initiatives (see Part II G).

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.44" + Indent at: 0.07"

Formatted

1.1.2. Consultation with country authorities to develop a handbook and best-practice guidance documents, outlining a homogenous strategy for remote sensing and field-based monitoring of glacier lakes and surrounding (periglacial) terrain, using common data sources and techniques.

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.44" + Indent at: 0.07"

Formatted

1.1.3. User-friendly visualization and analytical toolbox for anticipating where new lakes and therefore threats will develop over the 21st century as glaciers retreat.

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.44" + Indent at: 0.07"

Formatted

Output 1.3: Regional capacity building and twinning programme implemented, focusing on coordinated monitoring of glacier lakes and anticipation of future glacier lake formation.

Formatted: Right: 0.08"

Formatted

Indicative activities under Output 1.3 will include:

Formatted: Condensed by 0.05 pt

1.3.1. Training workshops conducted with local authorities in each country to ensure understanding of mapping and monitoring strategies, and providing an introduction to adaptation response strategies.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.4" + Indent at: 0.07"

1.3.2. Capacity building and twinning program developed and implemented in local universities, ensuring next generation of young local scientists are equipped with fundamental knowledge regarding the cryosphere, glacier lakes, and related hazards.

Formatted

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.4" + Indent at: 0.07"

1.3.3. Regional workshops to facilitate exchange of knowledge and experience between countries, with view to establishing a permanent ongoing exchange mechanism.

Formatted

Formatted: Condensed by 0.05 pt

Indicators for output 1.3: Number of participants (men and women) trained in lake monitoring and anticipatory techniques, new cryosphere focused educational material (number of lectures and practical exercises) introduced in local universities.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.4" + Indent at: 0.07"

Formatted

Formatted: Right: 0.08"

Component 2: GLOF vulnerability and risk assessment and elaboration of policy recommendations for adaptation

Formatted

Formatted: Heading 3, Right: 0.08"

This component is framed by the concept of climate risk, endorsed by the Intergovernmental Panel on Climate Change in their latest assessment reports (Special Report on Managing the Risk of Extreme Events and the Fifth Assessment Report). The concept encourages a holistic approach, recognizing that climate related risk results from a physical event or hazard (e.g. GLOF) intercepting with an exposed and vulnerable system (e.g. community), with risk reduction strategies such as EWS seen as a key tool for climate change adaptation. There will be two scales to the risk assessment. Firstly, an assessment for all lakes and associated downstream affected land areas will be conducted at the regional scale. While a core assessment procedure will be homogenised, some physical, societal, and economic drivers of risk may vary between countries, such that approaches will be

Formatted

Formatted: Right: 0.08"

Formatted

tailored for the local context. Secondly, based on the regional-scale assessment and consultation with local authorities, critical hot-spots of GLOF risk will be identified in each country. These hot-spots will be evaluated together with high-priority sites identified by local authorities, leading to local-scale assessments supported by field studies and validation at the most critical sites. This multi-level approach ensures that subsequent monitoring, preparedness, and EWS strategies are targeted to those lakes and downstream areas where risk of disaster is greatest.

Formatted

Formatted: Right: 0.08"

Component 2 will encompass the following Outputs and indicative activities:

Output 2.1: Regional-scale evaluation of GLOF risks, and local hazard assessments for critical valleys

Formatted

Formatted: Right: 0.08"

Indicative activities under Output 2.1 will include:

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

2.1.1. Development of a common GLOF hazard and risk assessment procedure, elaborated for the physical, social and environmental context of each country.

Formatted

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

2.1.2. Quantified likelihood of outburst established for every current and anticipated future glacial lake, and downstream flood-prone land areas identified.

2.1.3. Assessment of vulnerability and exposure of communities and infrastructure within flood-prone land areas based on proxy indicators (e.g. population density, urban land area etc.).

Formatted: Condensed by 0.05 pt

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

2.1.4. For selected hot spots of GLOF risk, comprehensive local-scale GLOF hazard assessment and maps will be established for both current and future scenarios.

Formatted

Formatted: Justified, Indent: First line: 0.05", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

Indicators for output 2.1: Number of potentially dangerous lakes identified by local authorities, identification of vulnerable communities exposed to GLOF threats, detailed field analyses undertaken by local authorities for highly susceptible lakes.

Formatted

Formatted: Right: 0.08"

Output 2.2: Vulnerability assessment and exposure maps for endangered communities, including gender and sector-specific analyses

Formatted

Formatted

Indicative activities under Output 2.2 will include:

Formatted: Right: 0.08"

2.2.1. Ground-level mapping and assessment of infrastructure and assets located within flood-prone valleys.

Formatted: Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

2.2.2. Community-level studies of vulnerability and perceptions of GLOF risk, through participatory surveys and interviews.

Formatted

Formatted: Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

Indicators for output 2.2: Total population and value of assets/infrastructure located within mapped zones of high GLOF hazard, percentage of threatened population

Formatted: Right: 0.09"

Formatted

interviewed (by sex) and surveyed, percentage of marginalised population or those representing highly vulnerable sectors (e.g., agricultural sector) engaged in the community survey and expressing positive benefits from this engagement.

Formatted

Formatted: Right: 0.08"

Output 2.3: Documented review of adaptation options and response strategies that can reduce the risk of GLOF disaster.

Formatted: Condensed by 0.05 pt

Indicative activities under Output 2.3 will include:

2.3.1. Elaborated basket of hard and soft adaptation options, including no-regret adaptation options.

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

2.3.2. Community level feasibility study to evaluate the local adaptation needs and expectations.

Formatted

Indicators for output 2.3: Number of adaptation options proposed and considered feasible by local authorities, percentage of population in threatened communities engaged or feeling represented in the adaptation planning process, percentage of population (by sex) in threatened communities indicating an expected reduction in their vulnerability and/or exposure to GLOF risk as a consequence of the proposed adaptation options.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

Formatted

Formatted

Component 3: Elaboration of EWS technologies, tailored to local contexts to ensure long-term maintenance and sustainability

Formatted: Heading 3, Right: 0.08"

Formatted

Early Warning is "the provision of timely and effective information, through identified institutions, that allows individuals exposed to hazard to take action to avoid or reduce their risk and prepare for effective response". The importance and need to promote, invest in, develop, maintain and strengthen EWS is mentioned several times in Sendai Framework. In Component 3 the institutional mechanisms will be evaluated and established if needed, and EWS concepts will be elaborated for the study sites in each country as defined by the needs of the Governments and based on the findings from Component 2.

Formatted

Component 3 will encompass the following Outputs and indicative activities:

Output 3.1: Local to regional framework of institutional DRR context established and evaluated

Indicative activities under Output 3.1 will include:

3.1.1. Evaluation of process, roles and responsibilities of institutions and organizations involved in EWS as mandated by law in all project countries, Synchronization of GLOF specific aspects with existing mechanisms, institutional

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.5" + Indent at: 0.07"

Formatted

entities and platforms for other types of hazards for creating an institutional infrastructure for multi-hazard management of disaster risks.

Formatted

Formatted: Right: 0.08"

3.1.2. If required, establishment of required institutional mechanisms and framework conditions.

Formatted: Justified, Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.5" + Indent at: 0.07"

3.1.3. Evaluation and establishment of responsibilities for disseminations of warnings, including the evaluation of potential means for the communication of alerts and warnings to ensure all members of the population receive the message.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.5" + Indent at: 0.07"

3.1.4. Evaluation of long-term funding possibilities of EWSs, including maintenance costs.

Formatted

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.5" + Indent at: 0.07"

Indicators for output 3.1: All countries have institutional mechanisms for multi-hazard management of disaster risks established; Number of identified potential funding sources (internal and external) for sustainable EWS financing.

Formatted: Expanded by 4.25 pt

Formatted: Right: 0.08"

Output 3.2: Documentation of local knowledge on GLOF risks and related adaptation needs

Formatted

Indicative activities under Output 3.2 will include:

3.2.1. Evaluation of the risk perception of the local communities, including the local knowledge of current hazards and past events and how this is affecting their daily life.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

3.2.2. ~~efinition~~Definition of the needs for GLOF early warning based on the documentation of local GLOF risk perception and adaptation needs. Who needs to be warned, why, when, and how.

Formatted: Expanded by 1 pt

Formatted: Justified, Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

Indicators for output 3.2: Risk perception and local knowledge compiled/evaluated for each site of planned EWSs; Local knowledge applied and needs respected in each of the proposed EWSs.

Formatted

Formatted: Right: 0.08"

Formatted

Output 3.3: Design and implementation plans for three case specific EWSs

Formatted: Not Expanded by / Condensed by

Indicative activities under Output 3.3 will include:

3.3.1. For each study site: Identification of the environmental parameters critical for GLOF hazards and evaluation of monitoring methods (sensors and specifications).

Formatted: Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

Formatted

3.3.2. For each study site: Elaboration of a data storage and access system, pre-definition of warning thresholds.

Formatted: Condensed by 0.05 pt

Formatted: Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

Formatted

3.3.3. For each study site: Elaboration of institutional integration of EWS protocols with existing authorities, institutional entities and stakeholders.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

3.3.4. Information and capacity building with involved authorities on EWS implementation, operation, and maintenance.

Formatted: Expanded by 1.25 pt

Indicators for output 3.3: Number of people (by sex) involved, Interest in/degree of involvement of local governments/authorities in information and capacity building workshops related to planned EWSs; Number of planned EWSs adopted or implemented by governments/authorities.

Formatted

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.41" + Indent at: 0.07"

Formatted

Component 4: Targeted demonstration projects to introduce technologies and best practices for EWS for glacier lakes

Formatted: Heading 3, Right: 0.08"

Formatted

Based on the recommendation of the local authorities, and the results of the large-scale hazard and risk assessment (component 2), this component will implement one EWS tailored to the requirements of each participating country.

Formatted

Component 4 will encompass the following Outputs and indicative activities:

Output 4.1: EWS implemented

Indicative activities under Output 4.1 will include:

4.1.1. Identifying a company/institute, if possible local, to take over the technical engineering, including the acquisition of suitable equipment, the construction of the EWS stations, and the electronic and software engineering for the data transfer, processing and storage.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.43" + Indent at: 0.07"

Formatted

4.1.2. Detailed technical planning of the EWS: Identification of survey, monitoring, and communication stations; design of alerting and warning infrastructure and means of communication

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.43" + Indent at: 0.07"

Formatted

4.1.3. st phase of EWS (ca. 12 months) for system calibration and adjustment and familiarization by responsible authorities

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.43" + Indent at: 0.07"

Formatted

Indicators for output 4.1: Pilot demonstration EWS successfully implemented and running, protocols developed in collaboration with and approved by involved authorities

Formatted: Right: 0.08"

Output 4.2: Maintenance and financing strategy developed for ensuring long-term sustainability of the EWS

Formatted

Formatted

Indicative activities under Output 4.2 will include:

4.2.1. Elaboration of a maintenance plan in collaboration with the involved authorities

4.2.2. Evaluation of potential internal and external funding sources and financing schemes for ensuring long-term operation of the EWS

4.2.3. Acquisition of funds for long-term EWS maintenance and operation

Indicators of output 4.2: Degree of ensured long-term financing of EWS maintenance and operation

Output 4.3: Authorities and population trained and drilled through simulation exercises

Indicative activities under Output 4.3 will include:

4.3.1. Capacity building and information activities for EWS calibration and operation for involved authorities.

4.3.2. Simulations with authorities and potentially affected population (or portions thereof).

Indicators of output 4.3: Self-dependent adjustments of the EWS by responsible authorities; number of drills conducted with authorities; number of simulations conducted with population

Component 5: Establishing synergies and synchronising knowledge exchange, stakeholder engagement and communication activities

This component oversees the development and implementation of knowledge management, exchange, stakeholder engagement and communication activities arising out of components 1 - 4. The primary goal of this component is to ensure that these activities are harmonised across the region, through joint meeting and workshop organization, design of common products (e.g. web knowledge platform) and shared resources (e.g. guidelines, policy briefs, and educational materials). In this manner, implementation of activities will be cost-effective and duplication of efforts can be avoided. Activities conducted under this component must draw on the strengths and diversity of the regional program, while being sensitive to local and site-specific requirements, thereby providing the foundation for successful and sustainable adaptation interventions.

Component 5 will encompass the following Outputs and indicative activities:

Formatted: Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.48" + Indent at: 0.07"

Formatted

Formatted: Heading 3

Formatted: Expanded by 2.95 pt

Formatted: Right: 0.08"

Formatted

Formatted: Condensed by 0.05 pt

Output 5.1: Web-based knowledge-platform established on GLOF risks and adaptation strategies

Formatted: Right: 0.09"

Indicative activities under Output 5.1 will include:

Formatted: Expanded by 0.1 pt

5.1.1. Establishment of modern, user-friendly web-based knowledge platforms, where data, maps, information and guidance documents produced under components 1 to 3 will be available to stakeholders and authorities, as a basis for awareness raising and adaptation planning.

Formatted

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

5.1.2. Common regional template established for the platform, allowing each country to tailor a cost-effective set-up that best suits their local context and needs

Formatted: Justified, Indent: First line: 0", Right: 0.09", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

5.1.3. Funding and technical strategy developed to ensure long-term maintenance of the knowledge-platforms

Formatted

Formatted

Indicators of output 5.1: Common web-based knowledge-platform implemented for all three countries, number of "hits" to the web-platforms as an indicator of the uptake and use by local stakeholders, percentage of sampled population with awareness and experience of using the web-platform, local authorities provide evidence of long-term web maintenance and funding strategies.

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

Formatted

Output 5.2: Education and training programmes undertaken to equip stakeholders with knowledge and capacity to prepare for, respond to and recover from GLOF disasters

Formatted: Right: 0.08"

Formatted

Indicative activities under Output 5.2 will include:

5.2.1. Engagement with local Universities to ensure knowledge and understanding emerging from this programme is transferred to the next generation of local scientists working in Central Asia (see also Output 1.3).

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

5.2.2. Enhancement and fostering of regional collaboration, through cost-effective joint training and education programmes (see also Output 1.3).

Formatted

Formatted: Justified, Indent: First line: 0", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

5.2.3. Implementation of community level training based on common agreed standards and best practices, elaborated according to local experiences and contexts. (see also Output 4.2)

Formatted: Condensed by 0.05 pt

Indicators of output 5.2: Percentage of targeted population (by sex) within threatened communities who express a noted increase in their awareness of the GLOF threat and their role in preparing and responding to a GLOF disaster. Evidence that disaster response policies have been modified to include best practices developed in this program. Number of regional capacity building workshops implemented.

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.68" + Indent at: 0.07"

Formatted

Formatted: Right: 0.08"

Formatted

Output 5.3: Knowledge and lessons learned from the targeted demonstration projects disseminated within Central Asia and across other high mountain regions

Formatted: Not Expanded by / Condensed by

Indicative activities under Output 5.3 will included

Formatted: Not Expanded by / Condensed by

5.3.1. Scaling-up experiences and lessons learnt for other EWS implementations in CA.

Formatted

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.16" + Indent at: 0.32"

5.3.2. Exchange workshops with authorities from other than CA regions, and communication of outcomes and experiences to relevant institutions across high mountains in Asia (e.g. ICIMOD, and UN agencies).

Formatted: Justified, Indent: First line: 0", Right: 0.08", Outline numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: -0.16" + Indent at: 0.32"

Indicators of output 5.3: Overall number of technical documents, guidelines, and reports capturing knowledge and experiences gained in this programme. Number of external organizations both within CA and beyond (not directly involved in the programme implementation) who are aware of the project outcomes and have transferred the lessons learned to their own regions.

Formatted

Formatted

B. Describe how the project /programme would promote new and innovative solutions to climate change adaptation, such as new approaches, technologies and mechanisms.

Formatted: Justified, Indent: Left: 0.07", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

This project provides an innovative holistic approach to climate change adaptation in Central Asia, bringing together the latest scientific understanding of glacier changes and related GLOF threats, design of adaptation strategies and implementation of a technologically advanced EWS, and compressive strengthening of institutional and societal capacities. The new scientific understanding and baseline knowledge resulting from this program will be centred on state-of-the art approaches used for monitoring glacier lakes and their surrounding terrain, hazard and risk assessment and adaptation. Project partners from Switzerland bring long-standing expertise in these fields and have been at the forefront of developing modern remote sensing, ground-based, and modelling approaches optimised for regional-scale GLOF hazard and risk assessments. This partnership will ensure that local authorities and institutions are best equipped to monitor and respond to the rapidly emerging GLOF threat. Hazard and risk assessment procedures will be implemented within a modern Geographic Information System (GIS), and integrated within an innovative web-platform that provides user-friendly, intuitive, and interactive access to all stakeholders.

Formatted

As emphasized in the Sendai Framework, EWS are a key mechanism to achieve DRR and CCA, through reducing societal vulnerability. This project will implement a technologically advanced EWS that integrates ground-based sensors with modern satellite-based earth observation techniques, providing full system monitoring. Latest advances in communication technology will ensure timely and reliable transfer of data and warning services to authorities and the communities. However,

Formatted: Right: 0.08"

Formatted

experiences have shown that technology needs to be balanced against local capacities, and hence there is heavy emphasis in this project towards education and training of local authorities to ensure long-term success and sustainability of the adaptation measures. In this context it is of vital importance that local schools in the mountains are actively involved in the project through learning exercises and also to ensure that parents and the rest of the community are informed about possible GLOFs and DRR.

Formatted

Scientific and technological advances in modelling, monitoring and predicting capabilities would bring benefits to early warnings once science is translated into effective DRR actions. Bridging the gap between scientific research and decision making will make it possible to fully exploit capacities of EWS technologies for societal benefit. Therefore, existing research networks will also be supported to allow for synergistic activities and interdisciplinary research. This will improve communication between scientists, and decision-makers, DRR experts, authorities in charge of emergencies and affected segments of the local population. Such coherent initiatives for collaborative action and adaptation to impacts of climate change in mountainous regions of CA, which are planned to be implemented in the project, are lacking in the region.

Formatted

In recognition of the potential for this innovative project to provide a reference and guidance for broader CCA and DRR activities across Central Asia, the Project Implementation Unit (PMU) will be supported by an Information and Experience Sharing Committee (IESC), (Part III A.). This committee will further contribute towards ownership, high visibility, transparency and improved exchange of knowledge, experiences and information among stakeholder across Central Asia. In the context of Central Asia, the IESC is a real innovation as currently there are no modern/technological mechanisms in place, which lead to a better understanding of DRR caused by GLOFs and climate change.

Formatted

Formatted: Right: 0.08"

- C. Describe how the project / programme would provide economic, social and environmental benefits, with particular reference to the most vulnerable communities, and vulnerable groups within communities, including gender considerations. Describe how the project / programme would avoid or mitigate negative impacts, in compliance with the Environmental and Social Policy of the Adaptation Fund.

Formatted: Justified, Indent: Left: 0.07", Right: 0.08", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted

The adverse impacts of climate change and particularly water-related disasters are recognized by the United Nations as one of the greatest threats to sustainable development globally. Frequently it is the most marginalised and vulnerable members of societies who live in the most exposed riverside locations, and therefore, the approach to hazard and vulnerability mapping employed under components 2 and 3 of this project will identify such risk "hot-spots". Hence, targeted measures implemented in this project that aim to increase societal resilience, reduce vulnerability, and thereby minimise losses to future GLOF events will provide direct and significant economic and social benefits, to those sectors and members of

Formatted

Formatted: Right: 0.08"

society who are most threatened. From an environmental viewpoint, damage and loss of valuable ecosystem services can be reduced, through GLOF mitigation and sustainable management of floodplain areas. For example, emphasis will be given to the conservation of forested slopes which provide natural flood buffering and protection.

Formatted: Right: 0.09"

Formatted

The project will also bring indirect economic and societal benefits as a result of strengthened capacities, awareness, and engagement in CCA. For example, the hydro-meteorological and cryospheric monitoring that will primarily serve as a basis for the EWS, will also provide data for improved management of hydrological resources and agriculture. In the process of enhancing disaster preparedness, non-governmental and community-based organizations will benefit from strengthened communication and outreach capabilities, which will be crucial to the successful and sustainable implementation not only of the GLOF EWS, but also broader CCA initiatives. In addition, isolated communities will become engaged in initiatives such as management of drainage channels, which provide both a source of employment (income) and reduce climate-related risks.

Formatted

During the scoping and consultation stage of this proposal, possible project implementation sites have been proposed by local authorities (as input to Component 4), and serve here to highlight the economic, social, and environmental benefits the project intervention could bring.

Formatted: Right: 0.09"

Formatted

In Kyrgyzstan, the Ala-Archa River valley is suggested as a project site, where the threat from the glacial lake Ak-Say has been recognized, and monitoring implemented by the Ministry of Emergency Situations of the Kyrgyz Republic. In the mountainous part of the Ala-Archa river valley, population density is low, and hence potential losses relate mainly to the tourism sector and environmental services. Further downstream however, potential losses increase significantly, including villages (such as Kashka-Su, Baityk, Zarechnoe and Orto-Sai) and Bishkek, the capital of Kyrgyzstan. GLOFs could cause here tremendous damage to settlements, roads, power lines, agricultural lands and pastures.

Formatted

Formatted: Space Before: 0.05 pt

Formatted

In Uzbekistan the transboundary Shakhimardan river catchment has been proposed as a project site in view of the 1998 flooding mentioned earlier. A GLOF from Alaudyn glacier lake in the Alay range discharged over 50 000 m³ from a termokarst lake on a debris-covered dead ice zone and killed 93 residents from Uzbekistan's Shakhimardan village. A key factor leading to the heavy losses in 1998 was the lack of warning, evacuation plans and other response strategies within the Shakhimardan enclave.

Formatted: Right: 0.08", Line spacing: Multiple 1 li

Formatted: Expanded by 3.45 pt

In Tajikistan the most highly exposed areas are Rivakdara and Varshezdara in the Gunt valley, Sezhdara and Durumdara in the upper Shahdara; Khidorjevdara, Sharfdara and dastdara (where in 2002 a GLOF event occurred) in the lower Shahdara. Among several GLOF-prone sites, the valley of lower Zaravshan has been suggested as pilot site in the northwest of the country, with total population of

Formatted: Right: 0.08"

Formatted

57,493. In this area seven potentially dangerous glacier lakes have been identified. The selection of a pilot site in Tajikistan will be agreed upon with national stakeholders during the national consultations process.

Formatted

The proposed project would address such crucial short-comings, and thereby significantly reduce societal vulnerabilities to future GLOF events, and ultimately minimise human and economic losses.

Formatted

Finally, at the policy level, the project will provide an enabling environment for the integration of CCA and risk management considerations into GLOF-affected sectors, such as land use planning, agriculture, forestry and disaster management. The interface between the policy level and local level institutions will be enhanced, in order to ensure evidence-based policy making that is informed by community needs. Involvement of communities and other stakeholders throughout the planning and design to the implementation and monitoring stages of the project will further enhance the economic and social benefits of the project, and ensure that communities are empowered to be in charge of their own protection from climate- induced risks.

Formatted

Implementation of the project, and particularly the EWS, will strictly adhere to local environmental policies and best practices. A typical GLOF EWS does not contribute towards any foreseeable negative environmental impacts. On the societal level, early engagement of the community and other stakeholders within the project scoping and implementation state will ensure the needs, expectations and wishes of the community are addressed.

Formatted: Right: 0.08"

Formatted

Since women and men are affected differently by disasters and climate change, their different vulnerabilities and capacities will be analysed, and their gender-specific concerns and priorities will be addressed. Women will be recognized for their resilience in the face of disaster, and for the roles they play as active agents of change in helping communities to recover and adapt. The aim is that during the project cycle, the policy work contributes to gender equality by improving the balance of power between women and men in the CA region to improve adaptation and resilience to climate change, thus contributing to SDG 5 of the 2030 Agenda.

Formatted

Special attention will be paid to the most vulnerable communities, namely, indigenous and ethnic minorities in mountainous areas, by developing of evidence-based adaptation practices. The project sites are home to many indigenous cultures as well as ethnic minorities, which often belong to socially-disadvantaged groups. In Tajikistan only for example the Pamir region is inhabited by Shughnis, Rushanis, Wakhis, Yazgulyamis, Ishkashimis and other groups (Gunt Valley and Shakh dara River valley) while another minority, Yaghnobi people inhabit Zeravshan valley, which is also one of the potential pilot site for the project. These communities are being most directly affected by the climate change impact on glacier melting, which resulted in occurrence of frequent and vast mudflows, damaging houses, and destroying the pastries and irrigation channels.

Formatted

D. Describe or provide an analysis of the cost-effectiveness of the proposed project / programme and explain how the regional approach would support cost-effectiveness.

Formatted: Justified, Indent: Left: 0.07", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

The cost-effectiveness of the proposed project relates to both the efficient and innovative implementation of the project components, but also the indirect cost-effectiveness as measured on the basis of the increased resilience and reduced vulnerability delivered by it.

Formatted

On the implementation level, the regional approach of the program will enable methods and approaches to be replicated across countries, with lessons learned and best practices shared between partners. The hazard and risk assessment in Component I will be based on freely available remotely sensed imagery and datasets, using techniques that have been optimised for regional-scale applications. Following the identification of risk hot-spots adaptation resources can then be targeted to the most critical locations, and implementation tailored to the local environmental and societal context. Tangible outputs emerging from the program (e.g., guidance documents, policy briefs, education and training materials, web portal) will be based on common templates, which are subsequently fine-tuned for each country, minimising the duplication of efforts and enhancing the cost-effectiveness of program implementation. Where possible, links to existing regional programmes and activities will be established and strengthened.

Formatted

The damage caused by GLOFs can be very high, not only for primary damage (loss of life, damage to infrastructure, buildings and agricultural land), but also secondary effects (e.g., disruption of main traffic axes, energy supply, and economic isolation of entire regions), as seen in the aftermath of the July 2015 mudflow in the Gorno-Badakhshan Autonomous Oblast (GBAO) of Tajikistan, where 80% of the communities in GBAO did not have electricity due to infrastructure damage and a temporary lake threatened downstream hydropower plants and infrastructure, including in a neighbouring Oblast. Relief and rehabilitation costs related to GLOF disasters normally vastly exceed the cost of DRR measures, in particular if secondary damages are considered as well. Hence the implementation costs of EWS can be significantly outweighed by the direct avoidance or reduction in damages caused by a GLOF event.

Formatted

Furthermore, the integrated EWS implementations to be elaborated in this project, can draw on the experience gained by the partners from universities in Switzerland over several years, in the Andes of South America, where pioneering GLOF EWSs have been designed and implemented. This expertise is complemented by long-lasting experience in cryospheric monitoring with different techniques in many mountain regions worldwide, including glaciers in the Pamir and Tien Shan. In both South America and Central Asia, the Swiss partners are long-term strategic partners from the Swiss Agency for Development and Collaboration (SDC). Integrating this know-how, directly into the proposed Central Asia project, including the experience

Formatted

in capacity building for the academic, public and private sectors, brings significant benefits and enhances cost-effectiveness.

In addition to the cost-effective benefits relating to the EWS, emphasis in this project is given to capacity building and training at multiple levels of society (see component 5). These relatively low-cost activities represent classic “no-regret” adaptation responses, which will bring immediate benefits to the communities, while also offering benefits over a range of possible future scenarios. In other words, even if in the best-case scenario a particular EWS is never activated by a GLOF event, the implementation and associated capacity building process will have led to a significant reduction in vulnerability of the threatened communities. As a by-product, the community builds awareness and resilience not only in relation to GLOFs, but more generally in relation to climate-driven changes and related hydro-meteorological threats. At the institutional level, regional workshops will provide a cost-effective opportunity to build and enhance collaboration across Central Asia, strengthening the capacity of the region to respond to the emerging threats of climate change, and particularly those related to the cryosphere.

Formatted

In sum: The development and application of coherent methods, procedures and activities across the region will strongly increase the cost-effectiveness, i.e. the impact per unit of investment will thus be clearly larger as compared to a local or national effort.

Formatted: Right: 0.08"

Formatted

- E. Describe how the project / programme is consistent with national or sub-national sustainable development strategies, including, where appropriate, national or sub-national development plans, poverty reduction strategies, national communications, or national adaptation programs of action, or other relevant instruments, where they exist. If applicable, please refer to relevant regional plans and strategies where they exist.

Formatted: Justified, Indent: Left: 0.07", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted

The project proposal has been prepared in accordance with prevailing National Sustainable Development Strategies and Adaptation Plans. A wide range of relevant national development programs and plans of Kyrgyzstan, Tajikistan and Uzbekistan were studied to identify the countries' main priorities and needs in the field of CCA, which form the basis of the project concept. The provisions of the following documents were considered during the elaboration of the concept:

Formatted: Right: 0.08"

Formatted

Kyrgyzstan:

- National Sustainable Development Strategy of the Kyrgyz Republic for 2013-2017;
- Program of the Kyrgyz Republic on Transition to Sustainable Development for 2013-2017;
- Priorities for Adaptation to Climate Change in the Kyrgyz Republic till 2017.

- National Communication of the Republic of Tajikistan under the UN Framework Convention on Climate Change.

Uzbekistan:

- National Strategy of Sustainable Development of Uzbekistan.

In conformity with the decisions of the Conference of the Parties to the UN Framework Convention on Climate Change, CA governments have submitted their Intended Nationally Determined Contributions (INDC), which were also considered for the project preparation. Thus, the main common aspects of the official national statements on INDC, including the reduction of vulnerability to the impacts of climate change by means of full-scale integration of climate resilience and adaptation measures into DRR area, as well as improvement of safety, livelihoods and health of the population in the context of climate change and dissemination of knowledge and experience on climate change at various levels, are also reflected in the concept document.

Relevant national strategies on DRR were also considered, including the National Strategy for Comprehensive Safety of Population and Territories of the Kyrgyz Republic from Disasters and Emergencies; National Disaster Risk Management Strategy of the Republic of Tajikistan and the State Programme of Uzbekistan on Forecasting and Preventing Emergency Situations. The DRR strategies of the CA countries are primarily in line with the priorities of the Sendai Framework, which also was instrumental for the project development.

The Sendai Framework which succeeded the Hyogo Framework of Action was adopted by UN Member States, including Kyrgyzstan, Tajikistan and Uzbekistan, on 18 March 2015 at the 3rd World Conference on Disaster Risk Reduction. As a result of this Conference, the CA countries issued a joint regional statement, where the governments of Kyrgyzstan, Tajikistan and Uzbekistan confirmed their commitments to the implementation of the Sendai Framework, emphasizing the need to consolidate the efforts of all interested parties, including international organizations, to foster regional cooperation in DRR. The Sendai Framework has become the accepted approach in dealing with DRR in Central Asia.

In their national statements on DRR the governments of Tajikistan and Kyrgyzstan have highlighted water-related disasters. Considering their prevailing transboundary effects, cooperation between the countries of the CA region was recognized as the only rational way to address water-related disasters and risks associated with them. The need to increase the resilience of populations, communities and countries to disasters, especially water-related disasters, was emphasized as one of the main focuses in implementing the Sendai Framework. Strengthening global and regional cooperation in DRR was recognized as crucial for the region.

F. Describe how the project / programme meets relevant national technical standards, where applicable, such as standards for environmental assessment, building codes, etc., and complies with the Environmental and Social Policy of the Adaptation Fund.

EWS will build on international standards, including the components of i) understanding risks, ii) monitoring and alert, iii) communication, iv) response.

The project is in full compliance with the Environmental and Social Policy of the Adaptation Fund (see Part II L).

The project is also in line with relevant national standards of environmental protection, human safety and protection from the natural hazards, including in particular the following:

- GOST R 22.9.09-2014 – National Standard of Kyrgyzstan: Safety in emergency situations. General technical requirements.

- ST RT GOST R 14031-2010 – National standard of Tajikistan: Environment management. Assessment of ecological efficiency. General requirements.

- O'z DSt 1016:2002 – National standard of Uzbekistan: Safety in emergency situations. Monitoring and forecasting of emergency situations. Main provisions.

- O'z DSt 1017:2002 – National standard of Uzbekistan: Safety in emergency situations. Monitoring and forecasting of emergency situations. Damaging factors. Nomenclature of the parameters of damaging effects.

- O'z DSt ISO 14001:2009 – National standard of Uzbekistan: Environment management. Technical conditions and guidelines for use.

G. Describe if there is duplication of project / programme with other funding sources, if any.

The proposed project will be the only regional initiative addressing GLOFs within the full context of climate change adaptation, extending from baseline knowledge and capacity building, monitoring and anticipation, through to development and implementation of adaptation strategies.

There are several projects by the World Bank in preparation or ongoing across Central Asia addressing issues of climate change adaptation and mitigation, water management, and establishing baseline monitoring of mountain climate and cryospheric changes (For example, the Climate Adaptation and Mitigation Program for the Aral Sea Basin does not cover risks associated with the GLOFs and the establishment of EWSs).

As described under component 1 of this proposal, synergies and links will be established with these projects to ensure the assessment of GLOF hazard and risk, and associated implementation of adaptation strategies draw upon the best available hydrometeorological and cryospheric baseline data from the region.

One of the ongoing activities in Central Asia is the project "Debris flow and outburst flood hazard in Tian Shan under impact of changing climate (DEFenCC)" financed

under the SCOPES initiative, and led by the University of Bern, Switzerland. The DEFenCC project aims primarily at improving the understanding of past and current GLOF and debris-flow processes at case study sites in the Tien Shan Mountains. This research project has neither the budget (approximately USD 200,000) nor mandate to complete a regional scale assessment, or facilitate the design and implementation of adaptation strategies. However, well-established linkages between the Swiss university partners, will ensure that relevant scientific understanding emerging from the DEFenCC project will feed into the larger, adaptation-focused project proposed here.

Formatted: Right: 0.08", Space Before: 2.75 pt

Formatted

Networking with global and regional research and resource centres working on GLOF issues will be established to institutionalize a well-connected knowledge base and analytical framework. In particular linkages will be established with the FOCUS Disaster Response Team in Tajikistan, which implemented a remote geohazard

Formatted

capacity building and monitoring project in 13 communities in Zaravshan Valley in Tajikistan. Linkages will also be established with two other ongoing UNESCO efforts at the global level: i) The impact of glacier retreat in the Andes: International Multidisciplinary Network for Adaptation Strategies, for exchange of information including links with the Snow Glacier Networks; and ii) Addressing Water Security: Climate Impacts and Adaptation responses in Africa, Asia and LAC, on knowledge management, as well as sharing the experiences of this project with other similar initiatives in participating countries, the wider region and the international community. ICIMOD in Nepal will also be an important source of knowledge. All knowledge, experiences and information will flow into the knowledge management (KM) system (see H. in this document)

Formatted

Formatted: Right: 0.08", Space Before: 0 pt

- H. If applicable, describe the learning and knowledge management component to capture and disseminate lessons learned.

Formatted

Formatted: Left, Indent: Left: 0.07", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Knowledge is defined as the understanding of reality based on people's experience, analysis and exchange. In the context of the proposed project, knowledge is recognized as the key to adapt successfully to climate change in the mountainous areas of Kyrgyzstan, Tajikistan and Uzbekistan. This knowledge has to be created, co-produced, compiled and made available for stakeholders and the interested public.

Formatted

As described in Section A of Part II of this document, the project will develop an internationally, regionally, nationally and locally institutionalized knowledge base and analytical framework for long-term tracking and management of GLOF and related climate change risks in the target countries. A result based KM system will be designed and implemented in consultation with all stakeholders using the latest technical expertise. A KM platform needs to be tailored to the local context and is a strategic part of the project. It reflects the activities and outputs all five components of the project. Clear mechanisms to manage knowledge and share/disseminate experiences need to be defined and created from the beginning. These mechanisms-

Formatted

need to be institutionalized at a national and regional level such that the benefits of the regional cooperation are sustainable.

Guiding principles and objectives for the KM system are:

- Keeping track of experience gained, presenting global, national and especially local knowledge on CCA with special reference to GLOFs, what kind of interventions work, identification of learning objectives and indicators;
- Develop an enabling environment for sharing the climate change knowledge amongst the CA stakeholders;
- Establish a climate change KM coordination framework which engages all stakeholders;
- Develop the capacity of the coordinating unit to effectively lead the management of GLOF/climate change knowledge;

- Develop and implement a mechanism for monitoring the application of GLOF/climate change knowledge by policy makers and people at the frontline of climate change impacts;
- Maintain a robust and up-to-date GLOF/climate change KM system.

Formatted

Formatted: Indent: First line: 0", Right: 0.08", Space Before: 0 pt, Bulleted + Level: 1 + Aligned at: -0.03" + Indent at: 0.07", Tab stops: 0.27", Left + Not at 0.52"

The KM system is a central part of the overall communication strategy of the project. It has to be developed with the participation of all project partners and stakeholders to identify the needs and capabilities of everybody directly involved and of all relevant target groups (media, politicians, public). The aim is to get strong identification with the project, to develop ownership and have a high visibility, which will eventually lead to sustainability.

Formatted

Formatted: Indent: Left: 0.07"

As a regional project there will be challenges from a language (English, Russian, Kyrgyz, Tajik, Uzbek), as well as from a technological (web-based, multi-media, radio, TV, print) point of view. It will be crucial to communicate effectively and efficiently. Therefore, a communication strategy for the project will be developed and implemented, which will highlight dissemination of project experiences to communities, educational institutions, NGOs, Civil Society Organizations, private sector institutions with a stake in the issue, and the larger public. This strategy will detail the use of print and electronic media and other communication channels (roundtables, participative community workshops, posters, brochures, booklets, pamphlets, news articles, radio and TV broadcasts, and web-based items). Lessons learnt from the project will be provided via a number of national, regional and international communication channels to increase their outreach (including radio and TV news pieces). This will enable adoption of project experiences in the up-scaling of EWSs and other response strategies outside of the immediate project area.

Formatted: Indent: Left: 0.07", Right: 0.08"

Formatted

In addition, this project's web site will serve as a workspace to be shared by project experts and stakeholders. Awareness campaigns through social media to the public and available communication tools for reaching the most remote populations are planned. Highest priority will be given to sustainability. Web site/resources beyond the duration of the project must be maintained. This can be achieved through a strong involvement of national governments, regional institutions and NGOs.

Formatted

Formatted: Indent: Left: 0.07", Right: 0.08"

- I. Describe the consultative process, including the list of stakeholders consulted, undertaken during project / programme preparation, with particular reference to vulnerable groups, including gender considerations, in compliance with the Environmental and Social Policy of the Adaptation Fund.

The declaration of the International conference on water-related natural disaster reduction, held in 2008 in Dushanbe, stated that research on the impacts of climate variability and change on water related disasters should be increased, in particular with the aim to develop adaptation strategies and mitigation measures. Water scarcity coupled with climate change related disasters was also recognized as a critical challenge in the CA region during the high level international conference on the implementation of the "Water for Life" decade, held in Dushanbe in June 2015.

obtained during the various consultations on project design that took place during preparation of the present concept, there is great confidence in the potential success of this project.

It must be pointed out that discussions are ongoing with Kazakhstan's authorities on technical aspects for joining the project, more consultations will take place in the next phase, during the full project proposal preparation. An endorsement letter for the project concept has been received by the Committee on Emergency Situations, Ministry of Internal Affairs of Kazakhstan in July 2016.

The whole consultation and project drafting process was guided by the AF recommended approach as described in the AF documents: Results Framework and Baseline Guidance - Project Level, Environmental and Social Policy of November 1003 and the Instructions for Preparing a Request for Project Funding of November 2013. Thereby special attention has been given to the inclusion of marginalized groups, women, ethnic minorities, indigenous people.

The stakeholder Involvement Plan is tentatively as follows, and it will be finalized for the full proposal:

List of Stakeholders/Name of Agencies

Kyrgyzstan:

1. Ministry of Emergency Situations
2. Central Asian Institute for Applied Geosciences (CAIAG)
3. University of Central Asia
4. Kyrgyz National University

situation changed slowly with the result that knowledge about climate change and the effects of glacier melting in the CA mountains became available: "The situation is alarming - glaciers melt at a very fast rate". Today no comprehensive or homogenous first order mapping and monitoring program on the regional level has been implemented, and databases on glacier lakes remain unequally developed and maintained. The lack of a regional approach to monitoring glacial lake development means that the threats are not addressed equally and there is no common basis for the design of response and adaptation strategies. Without a common regional approach, lakes which may provoke far-reaching or transboundary floods have not been systematically addressed. Monitoring systems are installed sporadically. The level of expertise within local responsible authorities remains unequal both between countries as well as between areas with different population levels. The involvement and capacity of the young scientists remains extremely low.

Adaptation alternative (with AF funding):

In conjunction with greater regional cooperation in the framework of this project, the strengthening of relevant institutions will take place for developing strategies towards hazards of a trans-boundary nature, such as GLOFs. Responsible authorities extend their capabilities beyond simply monitoring known threats, to the anticipation of where new potentially hazardous lakes will emerge as glaciers continue to retreat, allowing adaptation planning to be forward looking, and avoiding possible maladaptation. Rapidly emerging threats are identified and a common approach to monitoring and reporting lake developments is implemented across the region, with particular emphasis given to transboundary catchments. The causes and processes leading to hazardous lake formation are understood, and communicated to a wide-range of stakeholders. Engaging communities within the knowledge generation process enhances their understanding of the changing natural environment in which they live, and raises their awareness of the threats which are faced. In this manner, knowledge and awareness become the foundation for building resilience and reducing societal vulnerabilities. Regional workshops and joint training enables knowledge to be exchanged and methodologies fine-tuned based on local experiences. Training of the next generation of young scientists ensures the long-term sustainability of the monitoring programmes across the region.

Component 2: GLOF vulnerability and risk assessment and elaboration of policy recommendations for adaptation

Baseline (without AF resources):

No comprehensive or homogeneous first order GLOF risk assessment has been completed for Central Asia, meaning that some significant threats could remain undetected. Without a common assessment framework, the regional distribution of GLOF risk remains unclear and transboundary threats have not been systematically assessed. This may have prevented capacity building programs and other-

Formatted: Heading 3, Right: 0.08"

Formatted

Formatted: Space Before: 0.05 pt

Formatted

adaptation initiatives from reaching the most endangered or marginal communities and sectors, where potential losses from GLOFs could be greatest. Consideration has not been given to the possible changes in frequency and magnitude of future GLOF events, or change in exposure of communities and infrastructure, that will result from the growth and formation of new lakes over coming decades.

Adaptation alternative (with AF funding):

A first homogeneous assessment of GLOF risk across Kyrgyzstan, Tajikistan and Uzbekistan, providing the scientific basis for informed, and collaborative adaptation planning. Risk hot-spots are identified under both current and future climatic conditions, allowing adaptation resources to be targeted to those locations where society or sectors can benefit most. Within these hot-spots, local hazard maps

created for both current and future conditions, and exposed communities engaged with local authorities to develop a set of possible adaptation solutions, which are firmly embedded and supported within the local context. Transboundary risks identified and communicated across partner countries.

Formatted

Formatted: Right: 0.08", Space Before: 0 pt

Component 3: Elaboration of EWS technologies, tailored to local contexts to ensure long-term maintenance and sustainability

Formatted: Expanded by 4.25 pt

Formatted: Heading 3

Baseline (without AF resources):

The country preparedness and capacity of risk mitigation remains uneven including country capacity to react in case of the transboundary threats. Information for local communities is dispersed unevenly, and threats to remote and indigenous communities remain higher in all countries. Usually in CA the ministries have disaster management departments at national as well as province level and, in some cases, district level. However, a common problem is the general lack of equipment and finance available to these entities. Furthermore, despite the large amount of information that is available to them, resources and working practices are outdated. Another issue involves forecasting departments which although they are included within the ministries and have a good technical understanding of disaster prevention and preparedness, they lack a practical approach and coordination. As indicated by Tajik authorities, there is a lack of EWS on geohazards and water-related hazards. Moreover, those that exist are not properly translated into the local context, and local populations (local communities are not educated), especially the most vulnerable, remain at a highest risk from these hazards.

Formatted

Adaptation alternative (with AF funding):

Institutional mechanisms and framework conditions for effective DRR are established in all three countries, enabling transboundary hazards to be addressed as well. For the selected sites (one in each country) an adequate EWS solution is designed and implementation plans are elaborated based on the findings of

Formatted

component 2 and taking into account the local knowledge as well as the needs of the potentially affected population. On the local and regional level, roles and responsibilities related to the designed EWSs are clarified between involved authorities to ensure better coordination. The established institutional mechanisms allow not only the successful implementation of the designed GLOF EWSs, but provide the required framework conditions for effective DRR in general. Local populations, especially the most vulnerable are engaged, informed, educated, and develop GLOFs resilience.

Component 4: Targeted demonstration project to introduce technologies and best practices for EWS for glacier lakes

- Formatted: Expanded by 1.3 pt
- Formatted: Expanded by 1.35 pt

Baseline (without AF resources):

The capacity of local research and public institutions, as well as companies will continue to evolve only slowly and sporadically.

There is currently a lack of complex, comprehensive and coordinated EWS in Central Asia. Only in few places some hydrological measurements are taken, with cameras installed, for example in Kyrgyzstan in Aksai valley, or monitoring of some lakes in Tajikistan is taking place from helicopters. But no complex and coordinated system exists up to date in each of the countries. Besides the EWS response protocols remains outdated and uncoordinated between the countries, which is extremely important in case of Kyrgyzstan and Uzbekistan where the hazard has a transboundary nature.

Adaptation alternative (with AF funding):

At one site a state-of-the-art EWS for GLOFs has been implemented in collaboration with the local private sector. The EWS is operated by the responsible authorities, which were capacitated and trained for the operational service and maintenance. Financing for long-term maintenance is assured. Authorities and local population are well-trained to respond immediately and appropriately if a warning is activated. This demonstration EWS serves as an example for information and capacity building of authorities from the other two countries, and lessons learnt from this implementation can be transferred and scaled up to other potential EWS implementation sites in CA and beyond.

Component 5: Establishing synergies and synchronising knowledge exchange, stakeholder engagement and communication activities

Baseline (without AF resources): Despite numerous international/regional meetings and conferences, institutionalised knowledge exchange between countries/stakeholders remains very low, especially between responsible and conferences, institutionalised knowledge exchange between countries/stakeholders remains very low, especially between responsible

government bodies. Modern communication media (e.g., web-based knowledge exchange platforms) have not been developed in the context of CCA and DRM. Emergency preparedness remains uneven between communities, especially for those communities for which the level of threat is currently deemed low, but which might change in the future.

Adaptation alternative (with AF funding):

Risks associated with the rapidly changing cryosphere are elevated to be both a focus and stimuli for regional cooperation and exchange in the area of CCA across Central Asia. All key stakeholders have access to the knowledge and information needed for robust adaptation planning. Technical capacities and financial strategies are in place to ensure the long-term maintenance and sustainability of monitoring

K. Describe how the sustainability of the project / programme outcomes has been taken into account when designing the project / programme.

Formatted

Formatted: Left, Indent: Left: 0.07", Numbered + Level: 2 + Numbering Style: A, B, C, ... + Start at: 1 + Alignment: Left + Aligned at: 1" + Indent at: 1.25"

Formatted: Right: 0.08"

Formatted

The project idea and design is the result of a long process, which started during consultations with CA governments and discussions during conferences over the last three years. From the very beginning sustainability was the guiding principle when defining objectives, expected outcomes, outputs and activities of this project.

The project builds on existing institutions and will work out accepted mechanisms for efficient DRR action. Involvement of and close collaboration with Governments and responsible regional and national and local authorities at all stages of the project are crucial as well as collaboration with and involvement of the local population from the beginning of the design throughout the entire implementation. The involvement of school children in local educational programmes, as well as strengthening knowledge of students - future researchers in Central Asia - also contributes towards sustainability in addressing GLOF risks.

Formatted

Formatted: Right: 0.08"

The following strategies and lines of action are planned to secure sustainability of the EWS:

Formatted: Space Before: 0.05 pt

Formatted: Right: 0.09", Line spacing: Multiple 1.07 li

Formatted

Formatted: Not Expanded by / Condensed by

Formatted: Justified, Indent: First line: 0", Right: 0.08", Numbered + Level: 3 + Numbering Style: 1, 2, 3, ... + Start at: 1 + Alignment: Left + Aligned at: 0.09" + Indent at: 0.32"

Sustainability must be ensured along three main components of the EWS, which are 1) technical, 2) institutional, 3) social components. Full sustainability can only be achieved when all three components are sustainable on their own but also in relation to the other two:

1. Sustainability on a technical level requires appropriate technical instruments for the local conditions, both in terms of physical high-mountain environment and local

Formatted

Formatted

4. technical capacities available at the sites and in the region. The technical components of the EWS need to be adapted to local capacities, including to a level that capacities can be built and strengthened within the project.

2. Sustainability on an institutional level is particularly important and the frequent source of failure as past experiences demonstrates. Technical capacities of the responsible institutions are again an important element but not sufficient. Clear responsibilities need to be defined during the process of the design and implementation of the EWS. Key is the long-term maintenance of the EWS and for this purpose financial and personnel resources need to be planned and secured in the budgets of the local or national institutions. Budget restrictions need to be taken into account from the beginning of the project.

Formatted: Indent: Left: 0.4", Right: 0.08", Space Before: 2.75 pt, Line spacing: Multiple 1.06 li, No bullets or numbering, Tab stops: Not at 0.57"

3. Sustainability on the social level can only be achieved when the EWS has high acceptance within the local population. Their involvement from the beginning is critical to achieve this objective. The social conditions need to be carefully analysed from the beginning and strategies be defined to achieve long-term acceptance and support by the local affected population. Ownership is the ultimate objective.

L. Provide an overview of the environmental and social impacts and risks identified as being relevant to the project / programme.

Checklist of environmental and social principles	No further assessment required for compliance	Potential impacts and risks – further assessment and management required for compliance
Compliance with the Law	<i>The project is in compliance with all applicable domestic and international laws.</i>	
Access and Equity	<i>The project does not exacerbate existing inequities. On the contrary marginalized and vulnerable groups in the targeted mountainous areas will benefit from the project through the provision of knowledge and participation in project activities.</i>

International Hydrological Programme (IHP). In close cooperation with scientists worldwide, the IHP plays a vital role to establish a scientific and technological base for the sustainable management of water resources threatened by global climate change. The IHP strategy (Phase VIII, 2014-2020), "Water Security: Responses to Local, Regional and Global Challenges" among other themes is focusing on water-related disasters. UNESCO is coordinating projects and activities at global level on scientific collaboration including monitoring glaciers, snow and permafrost conditions and evaluating the implications of climate change on water resources and will provide feedback to develop appropriate adaptive strategies that countries need.

Formatted

UNESCO is engaged in supporting capacity building activities in glacier monitoring. It has been co-organizing and co-sponsoring trainings for young specialists from the CA (both in Tien Shan and Pamir mountains) and Andean region in the methods of glaciological monitoring for determining the parameters of glaciers mass balance.

Formatted

Universities from Switzerland hold long standing experience and scientific track record in glacier lake research, including aspects of past and future lake formation, lake and slope instability assessment and monitoring, both on the ground and by remote sensing methods, GLOF modelling, as well as assessment of hazards, vulnerabilities and risks. Recently, Zurich University has been instrumental in designing and implementing GLOF early warning systems in the Andes of Peru, in close collaboration with national and local partners from the public and private sectors and governmental authorities. Further recent expertise is also available from collaborations on GLOFs in Pakistan, India or Tajikistan, including capacity building of local experts, both governmental and non-governmental.

Formatted

The project technical and scientific activities will be conducted under the guidance of the UNESCO staff in UNESCO Almaty Office in consultation with UNESCO Headquarters in Paris and in cooperation with the UNESCO National Office in Tashkent (for Uzbekistan). UNESCO will have responsibility to secure the establishment and supervision of the Project Management Unit (PMU) that will be located in the UNESCO Almaty Office.

Formatted: Right: 0.08"

The Project Management Unit (PMU) which will be based in UNESCO Almaty Office, has the following tasks:

- co-ordinating institutional arrangements for management of the activities in the participating countries, the information sharing committee and the steering committee;
- co-ordinating policy and legislative development regarding GLOF;
- development of the KM and communication strategy;
- overseeing awareness and education activities;
- ensuring that possible partner agency programmes are fully integrated into the project framework;
- monitoring the results of the demonstration projects and supporting their integration into wider development programmes;
- monitoring technical assistance provided by the contracting agencies, including all institutional strengthening services provided to local communities and government bodies;
- monitoring all training activities;
- ensuring linkages to regional GLOF activities;
- reviewing annual work plans;
- developing the KM system.

Information and Experience Sharing Committee (IESC) will be established as part of the project and will represent a hub for international cooperation within the project's context and beyond. It will have an interministerial nature, formed by high level representatives of the various governmental agencies/ministries of the three countries involved in CCA and DRR. Its composition, functions and structure will be agreed upon among countries during the next stage of the project proposal.

National Execution Teams (NET) will be established in each of the three project countries. The NET will be headed by the national coordinator and one to three national experts. National coordinators will assist the Project Manager in coordinating project activities, they will also assist in securing regular engagement and coordination with the regional and local organizations, institutions and authorities involved in project implementation. They will be chosen among candidates nominated by the countries on the basis of agreed criteria.

Dedicated support by the PMU of the UNESCO Regional Office in Almaty will be provided on a regular basis. A comprehensive Results Framework of the project will be defined with execution indicators for project implementation as well as the respective means of verification. An M&E system for the project will be established based on these indicators and means of verification. Targeted M&E activities for the proposed project include the following:

Formatted

Formatted

A Project Inception Workshop will be conducted within three months of project start up with the full project team, relevant government counterparts and UNESCO. The Inception Workshop is crucial for building ownership for the project and to work out the first year annual work plan. An objective of the Inception Workshop will be to present the modalities of project implementation and execution, document agreement for the proposed executive arrangements amongst stakeholders, and to assist the project team to understand and take ownership of the project's goals and objectives. Another key objective of the Inception Workshop is to introduce the project team which will be instrumental in project implementation. An Inception Workshop Report will be prepared and shared with participants to formalize agreements decided during the meeting.

Formatted: Right: 0.08"

Formatted

A risk log will be regularly updated at intervals of no less than every six months in which critical risks to the project have been identified. Half yearly Progress Reports will be prepared by the PMU and verified by the Project Steering Committee. Annual Project Reports will be prepared to monitor progress made since the start of the project and in particular for the previous reporting period. These annual reports include, but are not limited to, reporting on the following:

Formatted: Space Before: 0.05 pt

Formatted

Formatted: Right: 0.08"

- Progress made towards project objectives and project outcomes - each with indicators, baseline data and end-of-project targets;
- Project outputs delivered per project Outcome (annual);

- Government authorities, members of Steering Committees and PMU will conduct regular field visits to project sites based on the agreed schedule in the project's Inception Report/Annual Work Plan to assess first hand project progress.

In terms of financial monitoring, UNESCO will provide with certified periodic financial statements, and with an annual audit of the financial statements relating to the status of funds according to the established procedures set out in the Programming and Finance manuals. The Audit will be conducted by a legally recognized auditor of the Government, or by a commercial auditor engaged by the Government (TBC). The project will undergo an independent Mid-Term Evaluation (MTE) at the mid-point of project implementation, which will determine progress being made toward the achievement of outcomes and identify course correction if needed. It will focus on the effectiveness, efficiency and timeliness of project implementation; will highlight issues requiring decisions and actions; and will present initial lessons learned about project design, implementation and management. Findings of this review will be incorporated as recommendations for enhanced implementation during the final half of the project's term. An external Terminal Evaluation will be conducted two months after project closure.

Type of M&E activity	Responsible Parties	Budget US\$ (excluding project team staff time)	Time frame
Inception Workshop (IW) and Report	PMU, UNESCO	Indicative cost: 10,000	Within first three months of project start up
Measurement of Means of Verification for project indicators	PMU National Project Coordinators (NPC)	To be finalized in Inception workshop	Start, mid and end of Project and annually when required
Annual and Quarterly Progress reviews	PMU, NPC	0 (staff time only)	Quarterly and Annually

Adaptation measure	Potential Benefits		
	Economic	Social	Environmental
Glacier lake monitoring and anticipatory programmes	<p>Early detection of threats, avoiding resources and assets from being built in harm's way.</p> <p>Prevention of costly maladaptation.</p> <p>Expanding lakes or new lakes can be identified, and potentially utilised as additional hydrological resources (hydropower, irrigation).</p>	<p>Communities engaged in the monitoring process, building their awareness and understanding of climate related threats.</p> <p>Early detection of threats minimizes the likelihood that vulnerable communities will later need to be resettled or displaced due to unforeseen threats. Hence, avoiding disturbances to family and community networks.</p>	<p>Locals become aware of the rapidly changing mountain landscape that surrounds them enhancing their engagement and participation in environmental protection.</p> <p>Early awareness of threats enables "soft" adaptation measures to be implemented, minimising exposure of people and assets. This prevents the need for subsequent "hard" engineering responses (flood walls, lake drainage etc.), that alter the natural environment.</p>
Glacier lake outburst flood hazard and risk mapping and land classification.	<p>Economically significant assets and resources in high risk zones can be relocated or protected, minimising potential losses.</p> <p>Landuse planning optimised to avoid future infrastructure and other resources being located in high risk zones.</p> <p>Large-scale hazard and risk assessments allow for identification of sites with high priority for intervention and thus guarantee an economic use of financial resources.</p>	<p>EWS and associated disaster response strategies can be targeted to provide protection of key community infrastructure and social services (schools, hospitals, places of worship) located in high risk zones.</p> <p>Hazard and risk mapping identifies where most vulnerable and marginalized members of society are threatened, allowing subsequent adaptation interventions (EWS, disaster response strategies and training) to be targeted to their specific needs.</p> <p>Signage within high risk zones warns of potential GLOF dangers, raising societal awareness. Particularly for women and children working on the river banks or flood-plain areas, such signage will raise their awareness of the possible dangers and appropriate response strategies.</p>	<p>In the highest risk zones, it may be desirable to leave land unattended and in a natural state. Likewise, (re)forestation/vegetation along river banks prevents erosion and reduces the potential GLOF impact in the identified high risk zones. Such "green-belts" ensure people and assets are not exposed, but also enhance the natural ecosystem.</p>

<p>Early warning systems and development of response strategies.</p>	<p>Prevention of injury and loss of life which inherently has a significant economic value.</p> <p>Local institutions, companies and labourers employed in development, construction and long-term maintenance of the EWS. Potential for further employment of their services if EWSs are replicated in other locations.</p> <p>Comparing implementation costs and value of saved lives results in very good cost-benefit ratios and implies that EWS are low-regret adaptation measures.</p> <p>Ensuring post-disaster economic losses are minimised, through fast and effective response strategies.</p> <p>Effective disaster response strategies ensure key services and networks remain operational during and after disasters, minimising economic losses and allowing a quick return to “business as usual”.</p>	<p>Prevention of injury and loss of life, minimising disruption to communities and families. Particularly important for women, who are often both the main caregiver and provider in a family.</p> <p>An EWS can significantly reduce vulnerability in situations where structural mitigation works are not feasible. Important for indigenous people and communities who are closely attached to their land and place high value on its environmental integrity.</p> <p>An EWS that is appropriately embedded in the local context can empower the local population, giving them protection and a sense of engagement and heightened capacity to deal with the threat of climate change.</p> <p>Institutional and social components (response strategies) developed as part of EWS implementation lead to improved risk management capacities of the local population and authorities to different types of hazards (also others than GLOFs). Societal resilience is enhanced.</p> <p>Most vulnerable members of society know what to do, and who to turn to in the event of a disaster. Their position transforms from being potential victims to being important actors in the disaster response chain.</p>
