

ADAPTATION FUND

AFB/PPRC.21/23
26 September 2017

Adaptation Fund Board
Project and Programme Review Committee
Twenty-First Meeting
Bonn, Germany, 10-11 October 2017

Agenda Item 6 s)

PROPOSAL FOR GUINEA-BISSAU

Background

1. The Operational Policies and Guidelines (OPG) for Parties to Access Resources from the Adaptation Fund (the Fund), adopted by the Adaptation Fund Board (the Board), state in paragraph 45 that regular adaptation project and programme proposals, i.e. those that request funding exceeding US\$ 1 million, would undergo either a one-step, or a two-step approval process. In case of the one-step process, the proponent would directly submit a fully-developed project proposal. In the two-step process, the proponent would first submit a brief project concept, which would be reviewed by the Project and Programme Review Committee (PPRC) and would have to receive the endorsement of the Board. In the second step, the fully-developed project/programme document would be reviewed by the PPRC, and would ultimately require the Board's approval.

2. The Templates approved by the Board (OPG, Annex 4) do not include a separate template for project and programme concepts but provide that these are to be submitted using the project and programme proposal template. The section on Adaptation Fund Project Review Criteria states:

For regular projects using the two-step approval process, only the first four criteria will be applied when reviewing the 1st step for regular project concept. In addition, the information provided in the 1st step approval process with respect to the review criteria for the regular project concept could be less detailed than the information in the request for approval template submitted at the 2nd step approval process. Furthermore, a final project document is required for regular projects for the 2nd step approval, in addition to the approval template.

3. The first four criteria mentioned above are:

1. Country Eligibility,
2. Project Eligibility,
3. Resource Availability, and
4. Eligibility of NIE/MIE.

4. The fifth criterion, applied when reviewing a fully-developed project document, is:

5. Implementation Arrangements.

5. It is worth noting that since the twenty-second Board meeting, the Environmental and Social (E&S) Policy of the Fund was approved and consequently compliance with the Policy has been included in the review criteria both for concept documents and fully-developed project documents. The proposals template was revised as well, to include sections requesting demonstration of compliance of the project/programme with the E&S Policy.

6. In its seventeenth meeting, the Board decided (Decision B.17/7) to approve "Instructions for preparing a request for project or programme funding from the Adaptation Fund", contained in the Annex to document AFB/PPRC.8/4, which further outlines applicable review criteria for both concepts and fully-developed proposals. The latest version of this document was launched in conjunction with the revision of the Operational Policies and Guidelines in November 2013 and amended in October 2016 following an update of the Operational Policies and Guidelines in March 2016.

7. Based on the Board Decision B.9/2, the first call for project and programme proposals was issued and an invitation letter to eligible Parties to submit project and programme proposals to the Fund was sent out on April 8, 2010.

8. According to the Board Decision B.12/10, a project or programme proposal needs to be received by the secretariat no less than nine weeks before a Board meeting, in order to be considered by the Board in that meeting.

9. The following fully-developed project document titled “Scaling up climate-smart agriculture in East Guinea Bissau” was submitted by the *Banque Ouest Africaine de Développement* (BOAD; West African Development Bank), which is a Regional Implementing Entity of the Adaptation Fund.

10. This is the fifth submission of the proposal. It was submitted as a project concept, using the two-step approval process, for the twenty-sixth and twenty-seventh Board meetings, and the Board decided to endorse it in the latter. It was then submitted as a fully-developed project document to the twenty-ninth Board meeting, and was not approved. It was subsequently submitted to the intersessional review period between the twenty-ninth and thirtieth meeting and the Board decided to:

(a) Not approve the project document, as supplemented by the clarification response provided by Banque Ouest Africaine de Développement (BOAD; West African Development Bank) to the request made by the technical review;

(b) Suggest that BOAD reformulate the proposal taking into account the observations in the review sheet annexed to the notification of the Board’s decision, as well as the following issues:

(i) The proposal should further clarify the pest management plan of the proposed project, considering the feasibility and timeliness of the proposed approach, as well as alternatives to pesticides;

(ii) The proposal should clarify the different elements of the environmental and social risk management framework of the project, and the links between them, including in the case of unidentified sub-projects;

(iii) The proposal should explain the decision-making process related to closures of downstream flows, including how it would be institutionalised and how the decision-making body would be (legally) empowered to make such decisions. This would not apply only to the closure moment of the water retention structure but to all water management decisions with a potential downstream impact; and

(c) Request BOAD to transmit the observations under item (b) to the Government of Guinea-Bissau.

Decision B.29-30/6

11. The current submission of the fully-developed proposal was received by the secretariat in time to be considered in the thirtieth Board meeting. The secretariat carried out a technical

review of the project proposal, with the diary number GNB/RIE/Agri/2015/1, and completed a review sheet.

12. In accordance with a request to the secretariat made by the Board in its 10th meeting, the secretariat shared this review sheet with BOAD, and offered it the opportunity of providing responses before the review sheet was sent to the PPRC.

13. The secretariat is submitting to the PPRC the summary and, pursuant to decision B.17/15, the final technical review of the project, both prepared by the secretariat, along with the final submission of the proposal in the following section. In accordance with decision B.25/15, a response table is also attached, explaining where and how the observations made by the Board when not approving the fully-developed project document in the intersessional review period had been addressed by the proponent in the current submission. The proposal is submitted with changes between the initial submission and the revised version highlighted.

Project Summary

Guinea-Bissau – Scaling up climate-smart agriculture in East Guinea Bissau

Implementing Entity: BOAD

Project/Programme Execution Cost: US\$ 798,000

Total Project/Programme Cost: US\$ 9,198,000

Implementing Fee: US\$ 781,000

Financing Requested: US\$ 9,979,000

Project Background and Context:

The overall objective of this project is to strengthen practices and capacities in climate-smart agriculture in the project region of dryland East Guinea-Bissau, and at institutional level. Through the project's activities food security and livelihoods are planned to be strengthened at household level while simultaneously increasing capacities in climate risk management and adaptation planning at all levels of governance. The project is planned to solidify and expand the activities of the LDCF-UNDP project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" both in the 14 original tabancas in Gabú 'region' of that project while integrating an additional ca. 26 tabancas in the 'regions' of both Gabú and Bafatá into the project's scope of action, with a planned total beneficiary target population of approximately 37,000 people in East Guinea-Bissau. The project is planned to address key vulnerabilities in agriculture and water resources management, and thus contribute to immediate and longer-term development and resilience needs of extremely vulnerable farmers, with a particular focus on extremely vulnerable groups: women, elderly and children.

Component 1: Development of technical and institutional capacity to address increasing climatic risk in adaptation practices and planning (US\$ 700,000)

According to the proposal, Guinea-Bissau has challenges in terms of the amount and quality of data and information as well as technical capacity to implement climate change adaptation. Despite progress through NAPA development, and an increasing number of scientific studies, important gaps remain with regards to climate impacts, socio-climatic vulnerability, and effectiveness of climate adaptation actions and planning. In this context, the project proposes a component for building technical and institutional capacity for climate change adaptation planning; both long-term perspectives on adaptive capacity building/policy development and near-term climatic risk management. Particularly this would include participative development of on-site agricultural and water-management adaptation actions and the development of contingency plans (e.g. flood protection) for climate-risk management. A further focus would be on the strengthening of interactions between relevant actors for climate change adaptation: government, meteorological services, agriculture sector, research institutions, regional and national government, and the media and local and indigenous communities.

Component 2: Enhance the resilience of existing agricultural productive systems, including water control and management measures (US\$ 7,550,000)

This component would focus on household-/village-level interventions in climate-smart agriculture practices in order to minimize damages from climatic change and variability, as well

as to contribute to agricultural and rural livelihood development. In this, the project would take advantage of 'windows of opportunity' for adaptation: for example, agriculture in the country is still largely organic, and relies on farmer's own seeds for cultivation. Agro-ecological approaches thus have a high potential, including in national adaptation strategies or policy design. While Component 1 is planned to serve as a key input for pre-selecting project sites, all field activities of project implementation would be carried out in Component 2.

Component 3: Knowledge management of lessons learned on climate-smart agriculture and adaptation planning (US\$ 150,000)

In order to guarantee visibility of the project results a knowledge management strategy would be developed. The core dissemination product from the project would be a manual of practical and concrete best-practice in climate resilient agriculture. Various versions of the Manual would be produced, both technical and non-technical, in Portuguese, French and English, as well as smaller summary briefing sheets/pamphlets/calendars on relevant thematic topics. The manual would be disseminated through the project website and a suite of workshops at the national and provincial level. In addition, dissemination would take place across the West Africa region through workshops and dissemination of hard copies. The project team would further interact with national media outlets (newspaper, internet, radio, etc.) to make the public aware of climate risks and adaptation needs. Scientific publications with regards to impact assessment of component 2 is also planned. Finally, the project results would also be shared through international fora on climate change.

ADAPTATION FUND

ADAPTATION FUND BOARD SECRETARIAT TECHNICAL REVIEW SHEET OF PROJECT/PROGRAMME PROPOSAL

Review Criteria	Questions	Comments on 1 May 2017	Comments on 22 May 2017	Answers references (August, 5 th 2017) (red color in full proposal)
Country Eligibility	1. Is the country party to the Kyoto Protocol?	Yes.		
	2. Is the country a developing country particularly vulnerable to the adverse effects of climate change?	Yes.		
Project Eligibility	1. Has the designated government authority for the Adaptation Fund endorsed the project/programme?	Yes.		
	2. Does the project / programme support concrete adaptation actions to assist the country in addressing adaptive	Broadly, yes. The review of the previous version of the proposal had noted that the proposal had stated that ramps for livestock and domestic water supply (Output 2.1.4) would be managed by a committee, though the proposal had not		
	capacity to the adverse effects of climate change and build in climate resilience?	explained the composition and functions of the committee. This has been addressed in the current proposal.		

	<p>3. Does the project / programme provide economic, social and environmental benefits, particularly to vulnerable communities, including gender considerations, while avoiding or mitigating negative impacts, in compliance with the Environmental and Social Policy and Gender Policy of the Fund?</p>	Yes.		
	<p>4. Is the project / programme cost effective?</p>			
	<p>5. Is the project / programme consistent with national or subnational sustainable development strategies, national or subnational development plans, poverty reduction strategies, national communications and adaptation programs of action and other relevant instruments?</p>	Yes.		

	<p>6. Does the project / programme meet the relevant national technical standards, where applicable, in compliance with the Environmental and Social Policy of the Fund??</p>	<p>Yes.</p>		
	<p>7. Is there duplication of project / programme with other funding sources?</p>	<p>The review of the previous version of the proposal had noted that the proposal should elaborate on the planned project to be implemented with funding from the Green Climate Fund (GCF), and how the proposed project would be complementary and avoid overlap with it. The current proposal has explained some of the planned components of the planned GCF project but the explanation on how complementarity would be achieved and overlap avoided is limited to one sentence. CR1: Please explain, at the level of the project scope and if possible at the level of project components/outputs, how the proposed Adaptation Fund project and the planned GCF project would complement one another. If there is no scope for complementarity for any reason, it would be necessary to state that, as well.</p>	<p>CR1: Addressed.</p>	

	8. Does the project / programme have a learning and knowledge management component to capture and feedback lessons?	Yes.		
	9. Has a consultative process taken place, and has it involved all key stakeholders, and vulnerable groups, including gender considerations in compliance with the Environmental and Social Policy and Gender Policy of the Fund?	Yes.		
	10. Is the requested financing justified on the basis of full cost of adaptation reasoning?	Yes.		
	11. Is the project / program aligned with AF's results framework?	Yes.		
	12. Has the sustainability of the project/programme outcomes been taken into account when designing the project?	Broadly, yes. The review of the previous version of the proposal had noted that the proposal should elaborate on the institutional arrangement for managing fertilizer and pesticide inputs and agricultural equipment, which was		

proposed to be supported by an NGO, and alternatives to them, during and beyond the project, and refer to existing examples of whether such a model has been shown to work in Guinea-Bissau. The current proposal provides some additional information, though it mentions that there is no experience in using NGOs in service delivery since 1996 at the project location. The proposal has presented training and utilizing the experience of NGOs elsewhere in the sub-region as ways to improve performance. All in all, the planned model for management of pesticides and fertilizers remains unclear. A version of Pest and Pesticide Management Plan, in French, had been submitted together with an earlier proposal.

CR2: Please elaborate the roles of the NGOs and committees in pest and fertilizer management. Please provide an English language summary of the pesticide management plan, highlighting, among other things, the organizational responsibilities. Issues related to risk management should be integrated in the environmental and social management plan (ESMP). In line with the Adaptation Fund Environmental and Social Policy, under no circumstances Adaptation Fund funds can be used for the procurement of pesticides containing [WHO Class I or Class II active ingredients](#) or pesticides of which the composition cannot be ascertained. Please explain how experiences from elsewhere in the subregion would be transferred to the proposed project. Please explain if risks remain in the relatively untested solution building on support from NGOs.

CR2: Partially addressed. The roles of NGOs and committees in pest management have been clarified. An English summary of the pest management plan has been included in the proposal. A procedure to be used in case of a pest outbreak has been inserted in the ESMP in its entirety, however, please see CR below. The purchase of pesticides is limited to those of World Health Organization classes III and U. Lessons learning from other experiences in the region is latently present in the current pest management plan but should be more explicit (pending item).

CR2 : Please, refer to the pages : 121-123

Please, also refer to the page : 45 ; 152-153

The Adaptation Fund Board Decision B.29/15 called also for elaboration of potential alternatives for pesticide and fertilizer use. Such alternatives have not been presented in the proposal.

CR3: Please clarify whether (particularly non-industrial) alternatives for pesticides and fertilizers have been considered and how their feasibility has been assessed. If there are reasons why such alternatives have not been included in the plan, please explain what those reasons are. In the environmental and social management plan, it has been mentioned that BOAD may only purchase pesticides when their use is justified within a strategy of integrated pest management. However, the proposal does not mention this term.

CR3: Partially addressed. The action plan of the pest management plan is comprehensive but, as a whole, seems unsuitable for the intended purpose. It comprises five steps, of which some with multiple stages, to be completed upon the reporting by a beneficiary of a pest problem before action can be taken to address the pest outbreak. This may take weeks or months in the best of cases, which does not at all constitute a meaningful response to a farmer facing a pest outbreak. Alternatives to pesticides are favoured in this process and pesticides will only be used as a last resort.

CR3 : Please, refer to the pages : 121-123 ; 130-131, 152-153 ; 161-163 ; 166 ; 186 (line 1.2.1, 1.2.4 of the budget), 188 (line 2.1.3.7 of the budget).

	<p>13. Does the project / programme provide an overview of environmental and social impacts / risks identified, in compliance with the Environmental and Social Policy and Gender Policy of the Fund?</p>	<p>The review of the previous version of the proposal had noted that the assessment of environmental and social risks should be based on the actual risks and the Adaptation Fund’s Environmental and Social Policy (ESP), not solely based on national regulations. In the current proposal, the distinction between national and AF ESP requirements has been addressed.</p> <p>The review of the previous version of the proposal also pointed to inconsistent and confusing use of terminology. The current review finds that the terminology used (ESMF, ESMFP, ESMP etc.) with respect to ESP compliance has not been changed and remains confusing. CR4: Please clarify the terminology with regard to plans and frameworks used in environmental and social risk management.</p> <p>It is noted that the risks described under the Compliance with the law principle (p. 112) are not ESP relevant.</p> <p>The review of the previous version of the proposal had noted that potential risks related to relocation of livelihood activities had not been adequately addressed. The review of the current proposal finds that this has been addressed: risks related to ESP principles on involuntary resettlement, indigenous peoples and natural habitats are exclusion criteria for potential unidentified subprojects (USP) (p. 122).</p> <p>The previous review of the proposal also found that the proposal did not explain well the risk identification and management</p>	<p>CR4: Not addressed. On p. 107 it is clarified how the ESMFP with the outcome of the impact assessments of the unidentified subprojects (USPs) will become the project ESMP, but this is not reflected in the remainder of the document. ESMP will also still be the term used for the individual set of E&S management actions required for each USP.</p>	<p>CR4 : Please, refer to the pages : 51 ; 105-106 ; 111 ; 126-127 ; 145 ; 187 (line 2.1.0 of the budget)</p>
--	---	--	---	--

		<p>approach followed with unidentified subprojects (USP). The current proposal has noted that “The project category will determine the form of environmental and social impact assessment to undertake.” Please note that this is not in line with the ESP, which requires that impacts need to be assessed for all the principles for which risks are present, and that the impact assessment effort needs to be commensurate to the risk. Categorisation of USPs is not a ESP requirement. Otherwise, the procedure is adequate, taking into account the comments made higher.</p> <p>CR5: Please clarify how the USP environmental and social review process will be updated to comply with the ESP with respect to risk identification according to the ESP principles, and impact assessment commensurate to the risks rather than using a categorisation method.</p> <p>The previous review of the proposal also found that the proposal did not address how water retention structures might limit water availability downstream, and how negative impacts could be avoided or minimized. The review of the current version of the proposal finds that water release management tools have been added to the design of the water retention structures (pp. 54-55) but the water resources management aspect is largely absent.</p> <p>CR6: Please clarify how and by whom decisions on downstream flows will be made to prevent the environmental and social impacts downstream mentioned.</p>	<p>CR5: Addressed.</p>	
--	--	---	-------------------------------	--

			<p>CR6: Partially addressed. Table 17 (p. 111 of the tracked-changes version) mentions “with the agreement of the [Project Management Unit], Environmental and agricultural services, meteorological services, beneficiaries and downstream populations” as the process to decide on the closure of the downstream flow. As a process, this is inadequate. To be effective and sustainable, this decision-making process needs to be institutionalised and the decision-making body (legally) empowered to make such decisions. Furthermore, this would apply not just to the closure moment of the water retention structure but to all water management decisions with a potential downstream impact.</p>	<p>CR6 : Please, refer to the page : 110</p>
--	--	--	--	--

	1. Is the requested project / programme funding within the cap of the country?	Yes.		
	2. Is the Implementing Entity Management Fee at or below 8.5 per cent of the total project/programme budget before the fee?	Yes.		
	3. Are the Project/Programme Execution Costs at or below 9.5 per cent of the total project/programme budget (including the fee)?	Yes.		
Eligibility of IE	4. Is the project/programme submitted through an eligible Implementing Entity that has been accredited by the Board?	Yes.		
Implementation Arrangements	1. Is there adequate arrangement for project / programme management, in compliance with the Gender Policy of the Fund?	Generally speaking, yes.		

	2. Are there measures for financial and project/programme risk management?	Yes.		
	3. Are there measures in place for the management of for environmental and social risks, in line with the Environmental and Social Policy and Gender Policy of the Fund?	Yes. The review of the previous version of the proposal had noted that the proponent should provide further information on how the implementing entity (BOAD) would apply its Environmental and Social Management System (ESMS) to the project, in line with and to meet the Fund's ESP requirements, including detailed allocation of roles and responsibilities. The current proposal has addressed this finding.		
	4. Is a budget on the Implementing Entity Management Fee use included?	Yes.		
	5. Is an explanation and a breakdown of the execution costs included?	Yes.		
	6. Is a detailed budget including budget notes included?	Yes.		

	7. Are arrangements for monitoring and evaluation clearly defined, including budgeted M&E plans and sexdisaggregated data, targets and indicators, in compliance with the Gender Policy of the Fund?	Yes.		
	8. Does the M&E Framework include a break-down of how implementing entity IE fees will be utilized in the supervision of the M&E function?	Yes.		
	9. Does the project/programme's results framework align with the AF's results framework? Does it include at least one core outcome indicator from the Fund's results framework?	Yes.		
	10. Is a disbursement schedule with timebound milestones included?	Yes.		

Technical Summary

In the context of extreme vulnerability of family farmers to climate change in dry land East Guinea-Bissau, the overall objective of this project is to strengthen practices and capacities in climate-smart agriculture in the project region and at institutional level. Through the project's activities, food security and livelihoods are to be strengthened at household level while simultaneously increasing capacities in climate risk management and adaptation planning at all levels of governance. In particular, the project will solidify and expand the activities of GEF/UNDP-00077229 project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" both in the 14 original tabancas in Gabú 'region' of that project while integrating an additional ~100 tabancas in the 'regions' of both Gabú and Bafatá into the project's scope of action, with a total beneficiary target population of approximately 37,000 people in East Guinea-Bissau

The initial review made the following observations:

CR1: Please explain, at the level of the project scope and if possible at the level of project components/outputs, how the proposed Adaptation Fund project and the planned GCF project would complement one another. If there is no scope for complementarity for any reason, it would be necessary to state that, as well.

CR2: Please elaborate the roles of the NGOs and committees in pest and fertilizer management. Please provide an English language summary of the pesticide management plan, highlighting, among other things, the organizational responsibilities. Issues related to risk management should be integrated in the environmental and social management plan (ESMP). In line with the Adaptation Fund Environmental and Social Policy, under no circumstances Adaptation Fund funds can be used for the procurement of pesticides containing [WHO Class I or Class II active ingredients](#) or pesticides of which the composition cannot be ascertained. Please explain how experiences from elsewhere in the sub-region would be transferred to the proposed project. Please explain if risks remain in the relatively untested solution building on support from NGOs.

CR3: Please clarify whether (particularly non-industrial) alternatives for pesticides and fertilizers have been considered and how their feasibility has been assessed. If there are reasons why such alternatives have not been included in the plan, please explain what those reasons are. In the environmental and social management plan, it has been mentioned that BOAD may only purchase pesticides when their use is justified within a strategy of integrated pest management. However, the proposal does not mention this term.

CR4: Please clarify the terminology with regard to plans and frameworks used in environmental and social risk management.

CR5: Please clarify how the USP environmental and social review process will be updated to comply with the ESP with respect to risk identification according to the ESP principles, and impact assessment commensurate to the risks rather than using a categorisation method.

CR6: Please clarify how and by whom decisions on downstream flows will be made to prevent the environmental and social impacts downstream mentioned.

The final technical review finds that while some of the clarification request have been sufficiently addressed, others have not been.

	<ul style="list-style-type: none">- The proposal should further clarify the pest management plan of the proposed project, considering the feasibility and timeliness of the proposed approach, as well as alternatives to pesticides.- The proposal should clarify the different elements of the environmental and social risk management framework of the project, and the links between them, including in the case of unidentified sub-projects.- The proposal should explain the decision-making process related to closures of downstream flows, including how it would be institutionalised and how the decision-making body would be (legally) empowered to make such decisions. This would not apply only to the closure moment of the water retention structure but to all water management decisions with a potential downstream impact.	-

ADAPTATION FUND BOARD SECRETARIAT TECHNICAL REVIEW OF PROJECT/PROGRAMME PROPOSAL

PROJECT/PROGRAMME CATEGORY: Regular-sized Project

Country/Region: **Guinea-Bissau**
Project Title: **Scaling up climate-smart agriculture in East Guinea Bissau**
AF Project ID: **GNB/RIE/Agri/2015/1**
IE Project ID: Requested Financing from Adaptation Fund (US Dollars): **9,979,000**
Reviewer and contact person: **Dirk Lamberts** Co-reviewer(s): **Mikko Ollikainen**
IE Contact Person: **Mawuli Komi Amegadje**

Review Criteria	Questions	Comments on 24 August 2017	Comments on 17 Sept 2017
Country Eligibility	1. Is the country party to the Kyoto Protocol?	Yes.	
	2. Is the country a developing country particularly vulnerable to the adverse effects of climate change?	Yes.	
Project Eligibility	1. Has the designated government authority for the Adaptation Fund endorsed the project/programme?	Yes. Letter dated 16 August 2017.	
	2. Does the project / programme support concrete adaptation actions to assist the country in addressing adaptive capacity to the adverse effects of climate change and build in climate resilience?	Yes.	

	3. Does the project / programme provide economic, social and environmental benefits, particularly to vulnerable communities, including gender considerations, while avoiding or mitigating negative impacts, in compliance with the Environmental and Social Policy and Gender Policy of the Fund?	Yes.	
	4. Is the project / programme cost effective?	Largely yes. Based on the information provided, cost-effectiveness of the project can be concluded.	
	5. Is the project / programme consistent with national or sub-national sustainable development strategies, national or sub-national development plans, poverty reduction strategies, national communications and adaptation programs of action and other relevant instruments?	Yes.	
	6. Does the project / programme meet the relevant national technical standards, where applicable, in compliance with the Environmental and Social Policy of the Fund??	Yes.	
	7. Is there duplication of project / programme with other funding sources?	Yes. Complementarity with other initiatives and avoidance of overlap has been explained.	
	8. Does the project / programme have a learning and knowledge management component to capture and feedback lessons?	Yes.	

	9. Has a consultative process taken place, and has it involved all key stakeholders, and vulnerable groups, including gender considerations in compliance with the Environmental and Social Policy and Gender Policy of the Fund?	Yes.	
	10. Is the requested financing justified on the basis of full cost of adaptation reasoning?	Yes.	
	11. Is the project / program aligned with AF's results framework?	Yes.	
	12. Has the sustainability of the project/programme outcomes been taken into account when designing the project?	<p>Broadly, yes.</p> <p>The issue of responses to pest outbreaks has been adequately addressed, although testing for speed and efficiency of the process is still recommended. It is further suggested that the Regional Directorates of DPV can advise the PMU directly on the need for limited class III or U pesticides purchases. Higher levels (CNGP and BOAD) should be informed of the process but not required to a priori approve these purchases.</p> <p>CR 1: Please consider including in the proposal testing of the speed and efficiency of the pest outbreak response, as well as an adaptive response mechanism.</p> <p>The Adaptation Fund Board Decision B.29/15 called also for elaboration of potential alternatives for pesticide and fertilizer use. IPM has now a prominent role in the proposal.</p>	CR1: no information provided.
	13. Does the project / programme provide an overview of environmental and social impacts / risks identified, in	Largely adequate.	

	<p>compliance with the Environmental and Social Policy and Gender Policy of the Fund?</p>	<p>The terminology used for the different elements of the ESP compliance process is sufficiently clarified so that it may be seen as functionally equivalent to those used in the ESP.</p> <p>The process of decision making on downstream flows is clarified, as is how decisions will be made to prevent downstream environmental and social impacts. Nevertheless, the adequacy of the complex multi-party process is not proven, and should be tested and amended as required.</p> <p>CR 2: Please consider including in the proposal testing of the adequacy of the downstream flows decision making mechanism, as well as an adaptive response mechanism.</p> <p>CR 3: Please clarify or strengthen in the proposal the role of the project's grievance mechanism, and how all possibly affected (downstream) stakeholders will be informed of the existence of the mechanism and how to access it.</p>	<p>CR2: Addressed (p. 113)</p> <p>CR3: Addressed</p>
	<p>1. Is the requested project / programme funding within the cap of the country?</p>	<p>Yes.</p>	
	<p>2. Is the Implementing Entity Management Fee at or below 8.5 per cent of the total project/programme budget before the fee?</p>	<p>Yes.</p>	
	<p>3. Are the Project/Programme Execution Costs at or below 9.5 per cent of the total project/programme budget (including the fee)?</p>	<p>Yes.</p>	

Eligibility of IE	4. Is the project/programme submitted through an eligible Implementing Entity that has been accredited by the Board?	Yes.	
Implementation Arrangements	1. Is there adequate arrangement for project / programme management, in compliance with the Gender Policy of the Fund?	Generally speaking, yes.	
	2. Are there measures for financial and project/programme risk management?	Yes.	
	3. Are there measures in place for the management of for environmental and social risks, in line with the Environmental and Social Policy and Gender Policy of the Fund?	Yes.	
	4. Is a budget on the Implementing Entity Management Fee use included?	Yes.	
	5. Is an explanation and a breakdown of the execution costs included?	Yes.	
	6. Is a detailed budget including budget notes included?	Yes.	
	7. Are arrangements for monitoring and evaluation clearly defined, including budgeted M&E plans and sex-disaggregated data, targets and indicators, in compliance with the Gender Policy of the Fund?	Yes.	
	8. Does the M&E Framework include a break-down of how implementing entity IE fees will be utilized in the supervision of the M&E function?	Yes.	

	9. Does the project/programme's results framework align with the AF's results framework? Does it include at least one core outcome indicator from the Fund's results framework?	Yes.	
	10. Is a disbursement schedule with time-bound milestones included?	Yes.	
Technical Summary	<p>In the context of extreme vulnerability of family farmers to climate change in dry land East Guinea-Bissau, the overall objective of this project is to strengthen practices and capacities in climate-smart agriculture in the project region and at institutional level. Through the project's activities, food security and livelihoods are to be strengthened at household level while simultaneously increasing capacities in climate risk management and adaptation planning at all levels of governance. In particular, the project will solidify and expand the activities of GEF/UNDP-00077229 project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" both in the 14 original tabancas in Gabú 'region' of that project while integrating an additional ~100 tabancas in the 'regions' of both Gabú and Bafatá into the project's scope of action, with a total beneficiary target population of approximately 37,000 people in East Guinea-Bissau.</p> <p>Three clarification requests were made:</p> <p>CR 1: Please consider including in the proposal testing of the speed and efficiency of the pest outbreak response, as well as an adaptive response mechanism.</p> <p>CR 2: Please consider including in the proposal testing of the adequacy of the downstream flows decision making mechanism, as well as an adaptive response mechanism.</p> <p>CR 3: Please clarify or strengthen in the proposal the role of the project's grievance mechanism, and how all possibly affected (downstream) stakeholders will be informed of the existence of the mechanism and how to access it.</p> <p>The final review finds that the revised document has adequately addressed the outstanding issues.</p>		
Date:	17 September 2017		

ADAPTATION FUND

**REQUEST FOR PROJECT/PROGRAMME
FUNDING FROM THE ADAPTATION FUND**

The annexed form should be completed and transmitted to the Adaptation Fund Board Secretariat by email or fax.

Please type in the responses using the template provided. The instructions attached to the form provide guidance to filling out the template.

Please note that a project/programme must be fully prepared (i.e., fully appraised for feasibility) when the request is submitted. The final project/programme document resulting from the appraisal process should be attached to this request for funding.

Complete documentation should be sent to:

The Adaptation Fund Board Secretariat
1818 H Street NW
MSN P4-400
Washington, D.C., 20433
U.S.A
Fax: +1 (202) 522-3240/5
Email: afbsec@adaptation-fund.org

ADAPTATION FUND

PROJECT/PROGRAMME PROPOSAL TO THE ADAPTATION FUND

PART I: PROJECT/PROGRAMME INFORMATION

Project/Programme Category:	Regular
Country/ies:	Guinea Bissau
Title of Project/Programme:	Scaling up climate-smart agriculture in East Guinea Bissau
Type of Implementing Entity:	Regional
Implementing Entity:	West African Development Bank (BOAD Regional Implementing Agency)
Executing Entity/ies:	General Direction of Environment/Secretariat of State of Environment and other Line Ministries
Amount of Financing Requested:	9,979,000.00 (in U.S Dollars Equivalent)

CONTEXT AND GENERAL FRAMEWORK OF THE PROJECT/PROGRAM

Provide brief information on the problem the proposed project/programme is aiming to solve. Outline the economic social, development and environmental context in which the project would operate

GEOGRAPHIC LOCALISATION

The Republic of Guinea Bissau is a West African coastal country with an area of 36,125 km² with 78% of continental and 12% of island (Bijagos archipelago). Its population is estimated to 1.73 million. Located east of the Atlantic Ocean, it borders are Senegal to the North and the Republic of Guinea to the East and South. The country organized into 8 major administrative 'Regions', which further divide into 'Sectors', 'Sections' and finally 'Tabancas' (villages) in decreasing levels of administration (Figure 1).

Figure 1: Administrative map of Guinea-Bissau
Source: Wikipedia.

SOCIO-ECONOMIC CONTEXT

Guinea-Bissau have a population estimated to 1.73 million with a density of 47.8 habitants per km². Bissau is the capital of Guinea-Bissau and the main administrative center, with about one quarter of the population living there. The annual rate in population growth is 2.54%¹. Despite high urbanization in recent years still about 58% of the population lives in rural areas. The project region (Gabú and Bafatá ‘regions’) covers a total area of 15,131 km², or 42% of Guinea-Bissau. Gabú with an area of 9,150 km² or 25% of the country is also the largest ‘region’ of all administrative regions.

The population of Guinea Bissau witch was 1 449 230 in 2009 will raise to 2 434 100 in 2030. The growth will be at least 68% of the population of 2009. In the project area (Gabù and Bafatà), the population will grow from 483191 people in 2016 to 682736 people in 2030 (see figure 2).

Figure 2: Growth of the population in the project area from 2016 to 2030 (Gabù and Bafatà)

The major socio-economic activities in the country lie is the exploitation of resources from agriculture, fisheries, forestry, livestock and mining extraction. Agriculture as primary economic sector of Guinea Bissau – alongside services – is largely based on subsistence farming, focusing predominantly on rice, cashew and livestock, employing 82% of the active population, generating 45% of GDP as well as the majority of exports receipts. The industrial sector is low in weight to the economy and focuses on the processing of cashew nuts.

It should be noted that, Guinea-Bissau is a Least Developed Country (LDC). The country has recently benefitted from considerable debt relief, which has helped the country to reduce its public debt to GDP ratio from a peak 113% of GDP end of 2009 to 28% of GDP by end of 2013 (IMF, 2014). While this has contributed to the stabilization of the economy with a GDP growth rate at 2.6 in 2014, 69% of the population continue to live below the poverty line, with 33% in conditions of ‘extreme poverty’ (<US\$1/day). The number of poor growth rate is estimated at

¹ Résultats de l’enquête approfondie sur la sécurité alimentaire et la vulnérabilité des ménages ruraux. République de Guinée Bissau, Mars 2011.

4.6%². GDP per capita is only US\$1,400. The gap between the average income of the poor and the poverty line, which expresses the depth of poverty is more pronounced in Guinea-Bissau (25.0%). Income inequalities between poor, that measure the severity of poverty, show that the poorest of the poor are more numerous in Guinea-Bissau (i.e. a rate of 12.4%)³. The majority of these populations poor reside in rural areas. It is in these rural areas that the project will intervene to help to reduce poverty and improve living conditions.

Guinea Bissau's health situation is equally characterized by low use of health services and vulnerability of populations, particularly mothers and children under 5 years. Life expectancy is low (50 years) and infant mortality rates are high. During the last severe cholera epidemic in 2005, about 25,000 cases were reported, mostly due to unsanitary conditions, resulting in 400 deaths by the national report on human development published by the United Nations (PNUD, 2008).

Food insecurity in Guinea Bissau is also common: despite high rice production, more than 30% need to be imported in order to cover the population's needs⁴. [Other speculations such as vegetables, tubers, oilseeds, maize, etc. are imported to cover the needs of a growing population.](#)

Food security is connected to world market transactions: in 2010, a strong rise in Thai rice prices (benchmark price for rice) from US\$380 to US\$495 due to heavy floodings in Thailand increased pressures on Guinea-Bissau's food supply. Climatic conditions also play an important role: low rainfalls in the beginning of the 2015 cropping season have led the World Food Program (WFP) to issue a warning on critical food security conditions for East Guinea-Bissau where, due to below average precipitation, cereal production could be expected to decrease by over 32% compared to the five-year average level (WFP, 2014). Currently 18% of children under 5 years are underweight, and the 3-year average prevalence of undernourishment is at 20% of the population (FAO, 2015). As a consequence, Guinea-Bissau's score on the Human Development Index (HDI) is 0.420 or place 178 out of a total of 188 countries (2014). This value is both significantly below average of the Human Development Report's 'Low Human Development Group' (0.493) and below the average of Sub-Saharan African countries (0.502) (UNDP, 2014). Fallow periods under slash-and-burn agriculture necessarily surpass those of alternative agricultural practices such as conservation agriculture, but currently land under fallow in Guinea-Bissau is often reused before a regeneration of soil fertility has occurred due to increasingly scarce land for food production (SEAT/DGA and Republic of Guinea-Bissau, 2011).

Guinea-Bissau has suffered from repeated, ongoing, political unrest in recent decades since independence in 1974, worsening already precarious economic and social conditions. Heads of state have been deposed or assassinated in repeat military skirmishes and coups, the most recent in 2009. The 2006 National Poverty Reduction Strategy Paper (PRSP) highlights government instability, mismanagement of public funds, structural constraints in the economy as key issues, including little diversification of income sources, low internal resource availability, weak human capital and lack of private sector dynamism. The PRSP's strategy focuses on a broad spectrum of issues to address these endemic problems, including instigating good governance, battling corruption, improving human rights, building institutional capacity and human resources, and increasing agricultural and fishing productivity alongside improving environmental protection. In addition, the PRSP points to an increasing involvement of well-informed NGOs and participation of a strong civil society, which can be mobilized to improve social and economic conditions. However, following the 2009 coup d'état political

stability has been considerably strengthened, particularly after the successful elections early 2014. This has led to renewed donor presence in the country and successful regional bond issuance, among other.

FOOD INSECURITY

The analysis of the evolution of the grain production shows that it follows a variable trend with an average growth rate of just 1% over the last decade (according to figures of the Ministry of agriculture). This grain growth is much lower than the population growth, which is 2.5%. As a result, grain production is insufficient to cover the food needs of the country estimated at 175 kg including 129,9 kg of rice per year and per person. The coverage rate of the grain needs of the country by national production was only about 58% over the period 2000-2010, compared to 72% on the period 1992-1997 reflecting a sharp decline of domestic production. Assuming the annual growth rate of grain production, which is 1% and the rate of population growth which is 2.5%, the coverage of the country's grain needs will be 40% in 2030 and that of rice by 35 percent (figure 3). The cereal deficit will be 253 168 tonnes including 238 373 tons of rice. The situation is going to get worse. But rice is not only the most widely grown cereal (75% of total grain production) but also the most consumed in Guinea-Bissau. Rice is consumed by about 90% of the households in Guinea-Bissau

Figure 3: Evolution of production and demand for rice and other cereals in Guinea Bissau

The figure above shows that the gap between production in rice or other cereals is widening more. However the rice deficit remains very high (see following figure). As a staple of more than 90 percent of the population, its impact on food security and the welfare of households will be strong.

Figure 3: Increase in the deficits in rice and other cereals in Guinea Bissau

These recurring deficits makes the population highly dependent on market during the lean season from May to October (figure 5) before the new harvest from October to January. About 76% of the households depend on markets for access to rice during the peak of the lean season (August) against 40% in November, 28% in December and 27% in January. The dependence on the market increases as one moves away from the harvest time and strengthens food insecurity.

Figure 4: Evolution of the dependence of households in markets for rice during the year

Source: Results of the survey on food security and vulnerability of rural households. The Republic of Guinea Bissau, March 2011.

This situation is common to all households regardless of their level of food insecurity or their livelihood (figure 9).

Figure 5 : Dependence of markets and seasonality according to livelihoods
 Source: Results of the survey on food security and vulnerability of rural households. The Republic of Guinea Bissau, March 2011.

Also, 20% on average, rural households are affected by food insecurity 8% affected by severe food insecurity, and 12% by moderate food insecurity (figure 7).

Figure 6: Food insecurity in rural areas
 Source: Results of the survey on food security and vulnerability of rural households. The Republic of Guinea Bissau, March 2011.

In the project area, moderate food insecurity affects 11 percent of the population in Bafata and 12% to Gabu. In both regions, 3% of the population are affected by severe food insecurity. These rates hide the depth of food insecurity within the villages where poor rural people to

over 70%, are forced to obtain most of their food on the market between May and October. The question is even more worrying when it comes to household kept by women. The rate of severe and moderate food insecurity is significantly higher among households headed by a woman (27.6% including 13.8% of severe food insecurity) than among households headed by a man (19.5% whose 7.3% of severe food insecurity). The majority of the heads of households women (61.9%) consisting of widows. With respect to the level of education of the household head, noted that the rate of food insecurity is significantly higher for households without education (23% with 10% of severe food insecurity) among households in which the head can read and write (16.3% including 4.7% severe).

The average share of food in total spending is 53% for food insecure populations while the share of rice in food spending expenditures represents 52.3% for people in severe food insecurity and 29% for populations in moderate food insecurity (see table below).

Table 1: Socio-economic characteristics of households in relation to food insecurity

Household characteristics		Food insecurity		
		Severe (%)	Moderate (%)	Severe and moderate (%)
Sex of household head	Woman	13.8	13.8	27.6
	Man	7.3	12.2	19.5
The head of household can read and write	Yes	4.7	11.6	16.3
	No	10.1	12.9	23.0
The average share of food in total expenses		52.0	53.9	53
Share of rice in food expenditures expenditures		52.3	29.7	46.0

To deal with the precarious food situation, households are appeal to a number of survival strategies for their food. Some of these strategies can improve short-term food security of the household but may be long-term negative. The investigation on food security and vulnerability of rural households reveals that the reduction in the quantities consumed by adults including youth for the benefit of the children is the most used strategy by the Bissau Guinean rural households. Also, the use of one such form of strategy contributes to weakening the adult members of the household and reduce accordingly their ability to procure food. Less preferred food consumption is also very intense. The other strategies are: (i) reduction of the amount of food eaten during the meal; (ii) the reduction in the number of meals per day; and (iii) dependent on the help of family or friends (see table below).

Table 2: Survival strategies developed by households

survival strategies	In food insecurity		In food security	Total
	Severe	Moderate		
Consumption of least favorite food	78.6%	57.5%	57.2%	59.0%
Dependence of the help of family or friends	67.2%	49.3%	51.2%	52.3%
Reduction of the food quantities consumed during meals	69.8%	51.7%	51.6%	53.1%
Reduction of the quantity of food consumed by adults for the benefit of children	72.1%	55.2%	59.6%	60.1%
Reduction of the number of meals per day	66.0%	50.7%	51.4%	52.5%

Source: Results of the survey on food security and vulnerability of rural households. The Republic of Guinea Bissau, March 2011.

These strategies not only to plunge people into a vicious circle where poverty and food insecurity are mutually reinforcing but show that there are real difficulties of access to food in Bissau Guinean rural and especially during the lean period.

The situation worsens over the years due to climate shocks including floods and droughts/irregularity of heavily rains affecting production. About 32% of rural households have cited drought / irregularity of rains and 33% cited flooding as the main shocks affecting agricultural production in recent years thereby exacerbating food insecurity. These shocks are: (i) the lack of mobilization of water for irrigation although it is available; (ii) damage related to very recurring Bush fires, (iii) bad agricultural practices and soil degradation; (iv) the plant disease and; (v) the increase in the prices of commodities food corollary of low production. More than one household in two (54%) in severe food insecurity or moderate said the rising prices of food as one of the most important shocks that have affected their food situation.

SOIL AND LAND USE

In the Republic of Guinea-Bissau, land is the property of the State and the common heritage of all persons. Land, as the basic physical support of the community, has eminently national value irrespective of the form of its use and exploitation. Improvements in the field may be public or private (Article 2 of the Law (Lei n°5/98 de 23 de Abril) on the land use). See annex 12.

In Guinea-Bissau the following types of soil are distinguished: Ferral soils, Plinthosols, sandy soils, hydromorphic soils and other types of substrate (Bouali, mud and sands). In the table below, the area occupied and percentage occupancy for each soil type is shown.

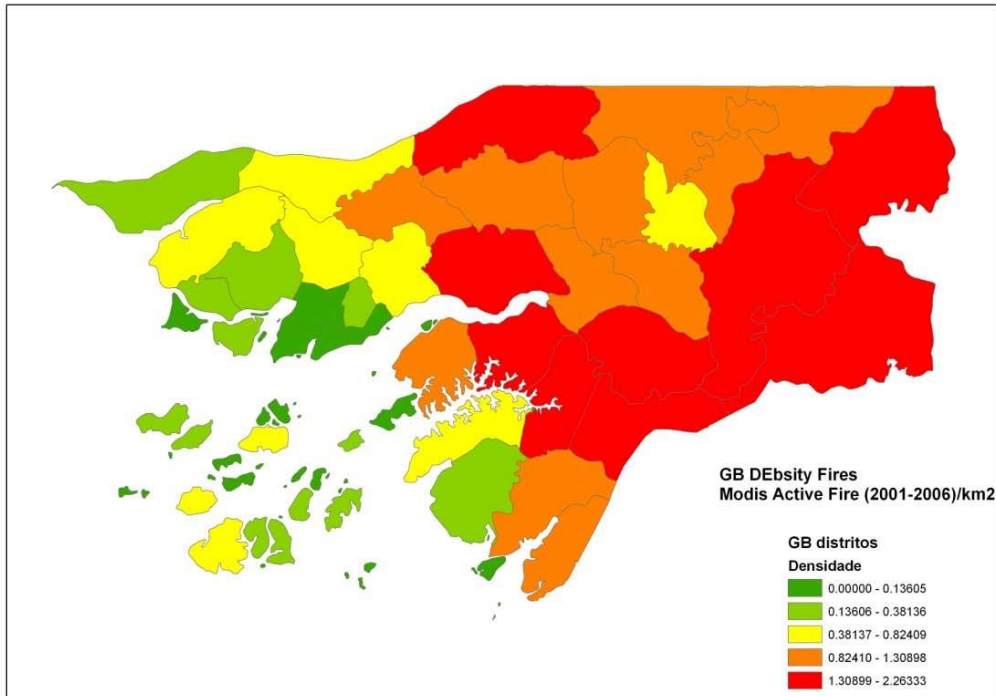

Table 3: Types of soil, surface and % of occupancy (adapted).

Soil types	Area (Ha)	% occupation
1 - Ferral soils (Ferralsols and Ferrallics)	1 960 000	62
2 - Plinthosols (Litosols and Litosols)	550 000	17
3 - Sandy soils (Regosols psamitic)	20 000	1
4 - Hydromorphic Soils:	650 000	20
4.1 - Gleisols (Continental)	150 000	5
4.2 - Riverine (Derived from marine alluvium)	500 000	15
4.2.1 - Tropical polders	100 000	3
4.2.2 - Halo - hydromorphic	400 000	12

Source: Second National Communication on Climate Change in Guinea-Bissau, 2011

The landscape of Guinea-Bissau comprises lowland coastal plains and mangrove swamps, which to the inland East give way to a savannah woodlands (deciduous) region, where this project ('regions' of Gabú and Bafatá) is to develop its activities. Tree growth in the savannah forest is limited mostly to the proximity to (perennial) streams and hillsides. Forest fires, either induced (slash-and-burn agriculture) or due to high temperatures and low rainfalls, occur frequently in the East, with an average fire density of 1.3 to 2.3 fires per km² per year, but on occasion up to 3.0 to 7.6 (World Bank, 2015).

The following figure shows the density of bush fires in different regions of Guinea Bissau.

[Figure 7: Density of fires in Guinea-Bissau, based on the composition of the images daily MODIS satellite between 2001-2006, adapted from the Project CARBOVEG-GB \(2007\)](#)

Ferralsols and Lixisols are the primary agricultural soils in the region. These are less productive than those found in rice cultivation in the country's flooded lowlands.

As of today, over 70% of Guinea Bissau is still forested, 45% of which primary forest. Guinea-Bissau's forests constitute an important carbon stock for West Africa: the total forest aboveground biomass (ABG) carbon stock in the region has been estimated at 96.93 Mt, with a mean forest AGB value of 65.17 Mg per hectare. Savannah woodlands in East Guinea-Bissau show lower average AGBs (Carreiras et al., 2012), but are important for conservation because of their spatial extension over the national territory (15,035 km² or 42%). The country is home to 620 species of amphibians, birds, mammals and reptiles (0.8% of which endemic) and over 1,000 species of vascular plants (1.2% endemic). In 2013, 61 species were considered as 'threatened species' under the IUCN Red List. Twelve species in this list (20%) are native species to Guinea-Bissau (IUCN, 2015).

In the rural parts of Gabú and Bafatá regions, pastoralists and small-scale farmers of different ethnics (Fula, Mandinga, other) have settled in the forest savannah thousands years ago, relying on shifting cultivation of sorghum, millet, maize, peanuts and sometimes rice and cattle raising (for milk as component of their diet). Cashew nuts are the main cash crop for >80% of rural households, which is either sold to traders or exchanged directly for rice when own rice stocks are low or production fails. Although permanent agriculture has increased in the region (Temudo et al., 2014), overgrazing, deforestation (annual rate at 1%) and soil erosion (especially under shifting cultivation) continue to exert pressure on regional ecosystems.

Itinerant slash-and-burn agriculture poses a substantial risk for sustainable land management in both Gabú and Bafatá regions. Fula and Mandinga, which are the most important ethnicities in absolute numbers in those 'Regions', routinely practice slash-and-burn agriculture to clear land for staple food production (sorghum, millet, corn or rice); but this practice is directly linked to ongoing land degradation, loss of soil nutrients and drying up of springs, and affects the resilience of their cropping systems. In this context, promising market development for cashew

nuts in the past two decades has led to an intensification of slash-and-burn practices in the project region as many farmers decided to participate in the commodity boom and clear forests near their villages to make room for cashew agroforests that show lower biodiversity compared to the traditional mix of croplands, fallows and forests. More recently, slash-and-burn agriculture is now used to clear older cashew orchards for cereal production in order to guarantee food production and security (Temudo and Abrantes, 2014, 2013). Otherwise, modern agricultural practices such as small-scale irrigation or animal traction for preparing soils are little disseminated.

[Figure 8](#): Burning practiced by farmers to prepare fields in the project area

[Figure 9](#): Field prepared with the practice of slash and burn

[Figure 10](#): Burning fire entering the forest

[Figure 11](#): Forest destroyed by the bushfires in the project area

Source : Global Lead, Sites works

Itinerant slash and burn agriculture (see figure above), hunting practices, honey and palm wine, extraction etc. cause bush fires with significant degradation of soil and destruction of forests. This results in shrinking the carbon sinks that are the forests and soils, reducing infiltration of rainwater with the corollary, soil erosion acceleration, flooding farmland in the rainy season, filling rivers and shallows by mud and sand (see figures below), draining soils in the dry season and the unavailability of water for irrigation.

Figure 12: Filling a river with mud and sand

Figure 13: Filling of arable land by sand

Source : Global Lead, Sites works

HYDROLOGICAL NETWORK

The country's hydrological network is large and complex, comprising rainwater resources, surface-water resources and underground-water resources, with significant stationary water bodies including lakes (such as the 35,000 ha Lake Cufada), inland valley depressions (*bas-fonds*), temporary water bodies (*vendus*) in the east, and aquifers. However, water access continues to be a main limiting factor for agricultural development in Guinea-Bissau's east region: tidal saline intrusion up to 175 km inland introduces salt water into aquifers which causes problems during dry season if extraction exceeds recharge rates. The low altitude of most parts of the country increases the risk of flood events near watercourses and coastal areas, particularly during and following the rainy seasons. Drainage in the interior of the country is problematic due to the limited permeability of many soils, exacerbating impacts of floods. Uses of perennial water courses are also very important to populations, but few freshwater courses in Guinea-Bissau are perennial, leading populations to rely on groundwater resources during the dry seasons. One exception is the Corubal river, the principal national surface water resource with average annual water volume of 130bn m³, whose rocky estuarine threshold protects the river from saline intrusion. However, the discharge rate of the Corubal is strongly seasonal, with its low at 8 m³/s in May (before rainy season) and 1,120 m³/s in September (end of rainy season). A second exception is the considerably smaller Geba river (annual water volume of 0.8bn m³) in eastern Guinea Bissau. However, the Geba suffers from water extraction upstream in Senegal for irrigation and further diverting due to dam construction, essentially rendering available dry-season volumes half of this total, exacerbating saline intrusion and threatening agriculture in east Guinea-Bissau. Both watercourses of the Corubal and Geba rivers follow through the project region.

It should also be noted that agricultural practices, the destruction of forests have strongly affected surface water resources by accentuating the phenomenon of erosion with result the silting up of watercourses in the area.

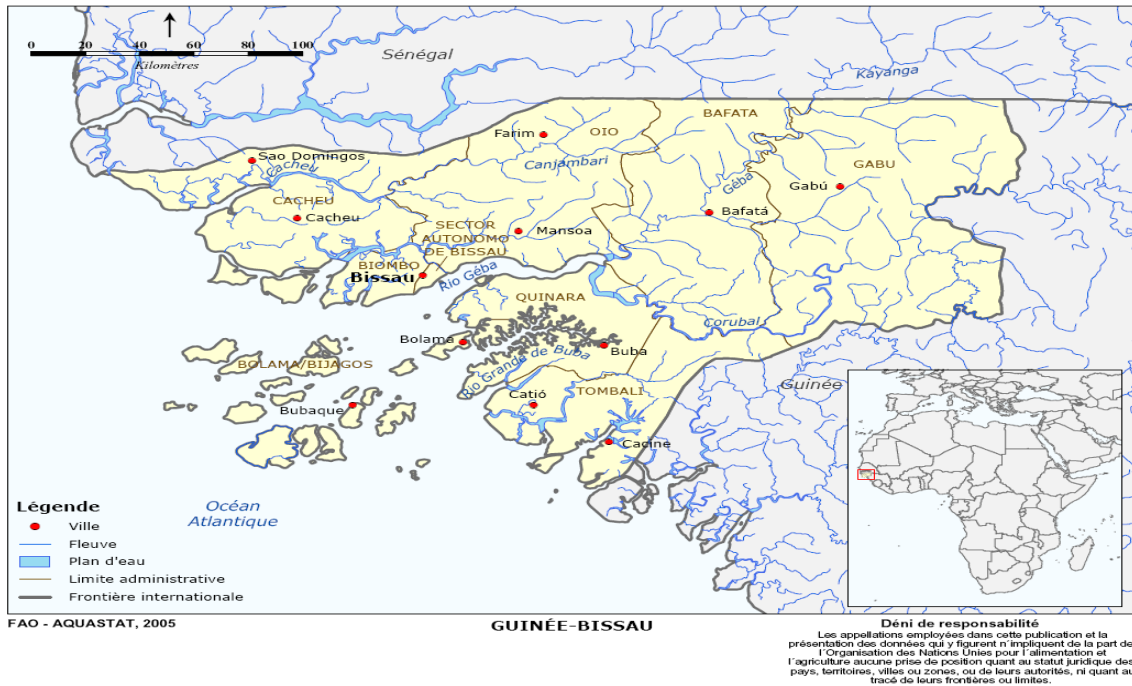

Figure 14: Surface Water network of Guinea-Bissau

Although the country has a major water system, the forests degradation reduces the retention capacity of the water by the soil and the forests. Reduction of forests and land degradation therefore reduce water infiltration into the soil with the consequent which is the unavailability of water to regulate rivers in dry season. In addition, heavy rains caused by climatic disturbances cause flooding. The result is a silting up and early drying up of the lowlands and watercourses, thus reducing the productive qualities of the soil.

Figure 15: Stream dried up early in the project area

Figure 16: Shallows flooded wells dried up early in the project area

FOREST, BIODIVERSITY AND PROTECTED AREA OF GUINEA BISSAU

As of today, over 70% of Guinea Bissau is still forested, 45% of which primary forest. Guinea-Bissau's forests constitute an important carbon stock for West Africa: the total forest aboveground biomass (AGB) carbon stock in the region has been estimated at 96.93 Mt, with a mean forest AGB value of 65.17 Mg per hectare. Savannah woodlands in East Guinea-Bissau show lower average AGBs (Carreiras et al., 2012), but are important for conservation because of their spatial extension over the national territory (15,035 km² or 42%). The country is home to 620 species of amphibians, birds, mammals and reptiles (0.8% of which endemic) and over 1,000 species of vascular plants (1.2% endemic). In 2013, 61 species were considered as 'threatened species' under the IUCN Red List. Twelve species in this list (20%) are native species to Guinea-Bissau (IUCN, 2015).

Guinea-Bissau currently has a network of six protected areas that occupy about 12.2% of the national territory.

The National Park of Orango (PNO): It is located in the south of the Bolama Bijagos archipelago in Guinea Bissau. It is one of the central areas of the Biosphere Reserve. It was created in 2000 by the Decree-Law No 11/2000 of 4 December 2000. Its area is 158,235 ha, of which 64 000 ha land. The terrestrial part is dominated by the oil palm (*Elaeis guineensis*), coastal shrublands and intertidal sand banks. The fauna is diverse and abundant. There are hippos (*Hippopotamus amphibius*) and crocodiles (*Crocodylus niloticus* and *Osteolaemus tetraspis*). The presence is noted from 5 species of marine turtles including green sea turtles (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), turtles olive ridley (*Lepidochelys olivacea*), loggerhead turtle (*Caretta caretta*) and leatherback turtles (*Dermochelys coriacea*). We also note the presence of the bushbuck (*Tragelaphus scriptus*), vervet (*Cercopithecus aethiops*), the humpback dolphin (*Sousa teuszii*) and the bottlenose dolphin (*Tursiops truncatus*). This park is home to the manatee (*Trichechus senegalensis*), a threatened species in the world, the gray parrot (*Psittacus erithacus*) species rare and endangered in the region.

The Natural Park of "Tarrafes" do Rio Cacheu (PNTC): It is created by the Decree No. 12/2000 of 4 December 2000 and located in the northwest of Guinea-Bissau, in the administrative region of Cacheu. It covers an area of 88,615 ha, of which 68% are covered by mangroves. Thanks to its area, it is considered the largest continuous block of mangrove forest in West Africa. The mangrove is home to many migratory birds. Regarding mammals, we note the presence of bottlenose dolphin (*Tursiops truncatus*) and humpback dolphin (*Sousa teuzii*). We also note the presence of hippopotamus (*Hippopotamus amphibius*), manatee (*Trichechus*

senegalensis), and green monkeys (*Cercopithecus aethiops*) and harnessed Guib (*Tragelaphus scriptus*). Regarding reptiles we find crocodiles (*Crocodylus niloticus*).

The Natural Park of the Lakes Cufada (NCCP): It is established by Decree-Law No 13/2000, of December 4 and is located south of Guinea-Bissau, in the administrative region of Quinara. With an area of 89,000 hectares, this protected area is the largest fresh water reserve in the country. It is a Ramsar site since 1990 because of its importance from the point of view of the birdlife, including 203 migratory bird species have been reported. Note the presence of White Pelicans (*Pelecanus rufescens*) and others from Europe and the Arctic. The fish fauna including tilapia is very important for local people. Large mammals are also present in lakes, including the buffalo (*Syncerus caffer*). Hippos (*Hippopotamus amphibius*) are also present. It was identified 54 species of mammals and 11 species of reptiles. Concerning flora, there are 615 species of vascular plants including 577 species of Angiosperms and 8 species of pteridophytes.

The National Park João Vieira-Poilão (PNMJVP): It is established by Decree-Law No. 6-A / 2000 of 23 August 2000 and is located southeast of the Bijagos Archipelago. It has an area of 49 500 ha. Three species of sea turtles frequent the beaches of the park (the green turtle, hawksbill and olive ridley). The islands are home to sub-humid Guinean forests. *Elaeis guineensis* palm grove is the dominant plant formation. It is associated with other tree species, shrub and herbaceous. The mangrove is in the intertidal zone. These islands are the most important area for the reproduction of marine turtles in the West of Africa (it is estimated that in 2001 there were laying between 7000-30000 eggs per year for green turtles (*Chelonia mydas*)).

Community Marine Protected Area of Formosa Islands, Nago and Chedia (AMPComplexe UROK). It is created by Decree-Law No 9/2005 of 12 July 2005 and is located north of the archipelago of Bijagos covering an area of 54,500 ha. The group of these islands is part of the central zone of the Biosphere Reserve. The largest area is occupied by mangroves. sand benches and vases, and the many channels with shallow waters, are critical habitats for reproduction and growth of many species of fish and crustaceans. Formosa island group is the most important place of the archipelago for avifauna, making him the second most important site for migratory birds of the West Africa. It is in this environment that we find the large number of animals important from the perspective of biodiversity conservation, including manatees (*Trichechus senegalensis*), hippopotamus (*Hippopotamus amphibius*), crocodiles (*Crocodylus niloticus* and *Osteolaemus tetraspis*), turtles (*Chelonia mydas* and *Eretmochelys imbricata*), otters (*Aonyx capensis*), dolphins (*Sousa teuszii* and *Tursiops truncatus*).

The National Park Matas Cantanhez (PNC). It is located in the southwest of the country and has an area of 105,767 ha. The sub-tropical rainforest is the dominant and is the last vestige of this training in Guinea-Bissau. The vast expanse of mangrove favors the cultivation of rice, why Tombali region is considered the country's breadbasket. The park is a very important game, including the chimpanzee (*Pan Troglodytes verus*), despite its rapid decline in Africa. It also counts the buffalo (*Syncerus caffer nanus*), the roan antelope (*Hippotragus equinus*), black and white colobus (*Colobus polycomos*) which is rare, and *Colobus badius*. Among the species of sub rainforest encountered include, Sougué (*Parinari excelsa*) Eyoun (*Dialium guineense*) and Emien (*Alstonia congensis*).

Although the biological diversity of Guinea Bissau is important, it is now highly threatened. The main causes are, among others: (i) poor agricultural practices (shifting cultivation practiced at the national level made through the clearing of vegetation, bushfires, ect); (ii) logging, sometimes beyond the control of the competent authorities; (iii) the degradation of natural formations due to the destruction of soil structure, water and wind erosion and poor land use; (iv) poverty is gaining more and more ground and forcing the population to survive, to use natural resources unsustainably. These protected areas are not located in the project area at

Bafata and Gabu. There is animal's corridors in the south of these regions. However, the project sites don't have communication with the said corridors. The implementation of the project do not affect protected areas and corridors of animals. The following map shows the location of the protected areas of Guinea Bissau and the corridors of animals.

CLIMATE CHANGE AND VULNERABILITY IN WEST AFRICA AND GUINEA BISSAU

➤ Climate variability and change

Guinea-Bissau has a typical hot, humid monsoon-like tropical climate, with two well-defined seasons. The rainy season is from mid-May to mid-November, with the dry season occupying the rest of the year. May and November are transition months between both seasons. Average temperatures in the rainy season range from 26°C to 28°C (30.5°C in April and begin of May), but are lower at <24°C during dry season when harmattan (dusty winds) may blow in from the Sahara. The coldest months of the year are December and January. Rainfall varies greatly regionally and seasonally, with overall rainfall reaching up to >1,800mm in the country's southern provinces, but only <1,200mm in the east. Historical observations show July and August as the rainiest months in Guinea-Bissau. Major droughts occurred in 1977, 1979, 1980, 1983, 2002, 2004 and 2013. The drought of 2002 affected an estimated 100,000 people which is more than any other climate-related disaster (including epidemics) between 1980 and 2010. High tides and torrential rainfalls in 2003, 2004 and 2005 destroyed makeshift housing and bridges in east Guinea-Bissau, forcing family farmers to abandon their houses (some permanently) and causing severe harvest losses. Floods of Geba and Corubal rivers' tributaries are particularly relevant in this respect (World Bank, 2015).

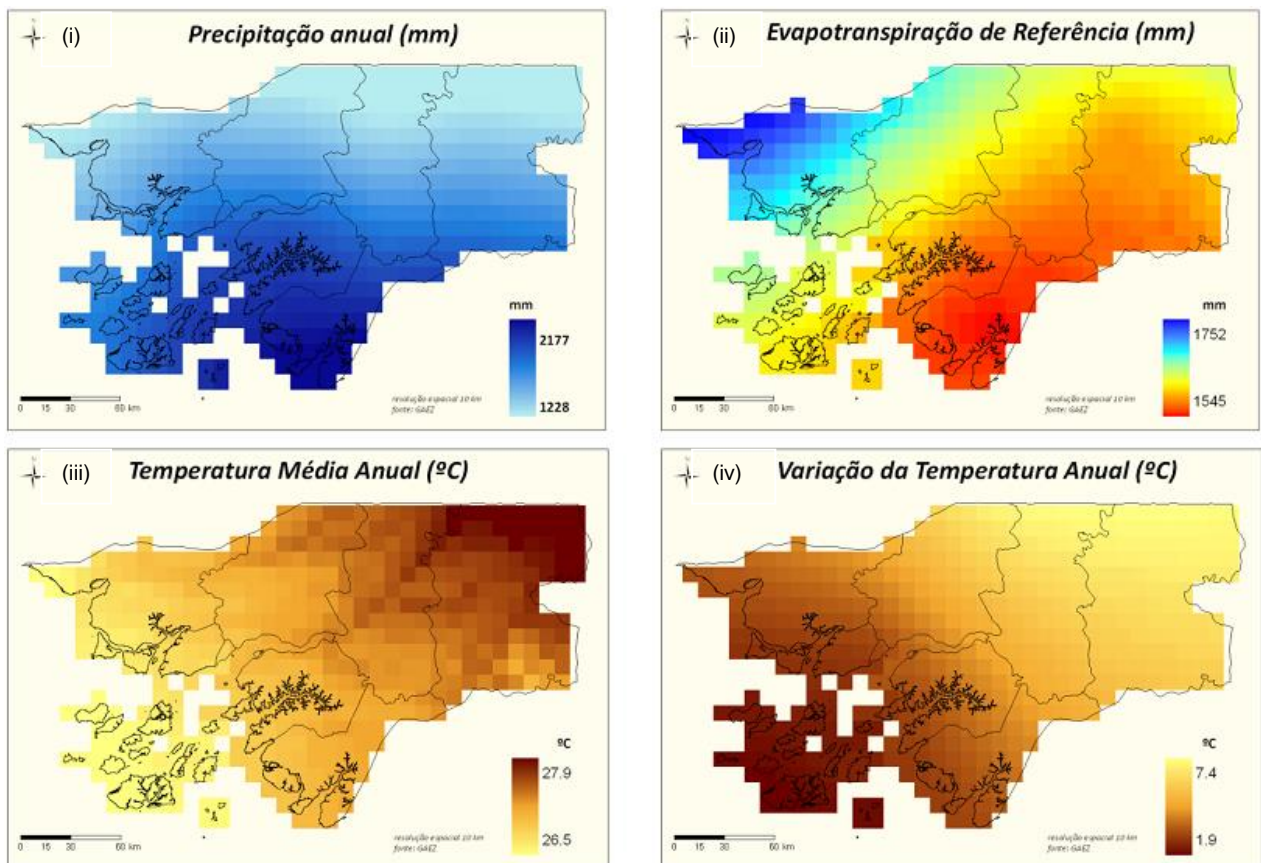

Figure 19: Climate in Guinea-Bissau: annual precipitation (mm) (i), reference evapotranspiration (mm) (ii), average annual temperatures (°C) (iii) and intra-annual temperature variations (iv), from upper left to lower right.

Source: SEAT/DGA (2013).

In comparison to other 'regions', Gabú and Bafatá show considerably (i) lower rainfalls, (ii) lower evapotranspiration, (iii) higher temperatures and (iv) higher intra-annual temperature variability (Figure 20) (SEAT/DGA, 2013). Average high temperature between 1981 and 2010 at Bafatá Station (main observation unit for East Guinea-Bissau) was at 34.6°C (30,9°C to

39,3°C) and average low temperature at 20.5°C (16,0°C to 23,2°C). For the same time period, average precipitation ranged between 1000mm to 1500mm, with ~80% of the rainfalls concentrated in the monsoon months of July, August and September. During the dry December to March months average monthly rainfalls fall to 0,0mm.

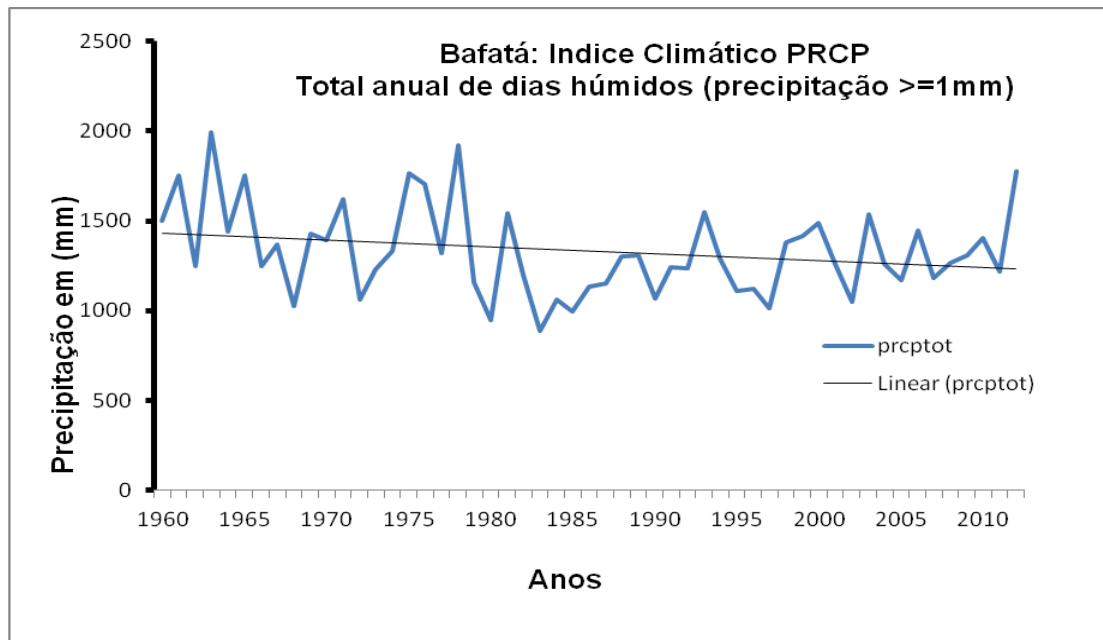

Figure 20: Total humid days per year (precipitation ≤ 1 mm), 1960-2010
 Source: INM-GB (2014)

According to data from Guinea-Bissau's National Meteorology Institute (INM-GB, 2014), several important changes in rainfall/humidity levels have been observed in the past decades. While the rainy season during the 1960s to 1970s usually started in the second half of May, observations now point at a later starting point in the month of June. There has also been a reduction in the total number of humid days per year: annual total wet-day precipitation (PRCPTOT) (precipitation ≥ 1 mm/day) shows a linear declining trend between 1961 and 2010 from ~1,500mm annual to ~1,250mm (Figure 20). This trend is indicative of a drier climate, and, most importantly, a higher susceptibility to drought in the region. These findings are confirmed by independent long-term (20 years) ethnographic studies in the project region: as related in Temudo and Abrantes (2014), family farmers find that more frequent poor cereal harvests are increasingly caused by a higher rainfall variability, particularly through longer dry spells. Higher frequency in pest and disease occurrence, as well as destructions of swamp rice field dykes by unusually high tidal waves are also observed by farmers in the region (Temudo and Abrantes, 2014).

The recent IPCC AR5 chapter on Africa (Niang et al., 2014) finds that current changes in mean annual temperatures and precipitation will continue to show effect over the whole African continent, independent of low RCP2.6 or high RCP8.5 emission trajectories, with climatic change on the continent to occur at a faster speed than anywhere else on the globe. In general, temperature projections for West Africa show a mean +3°C to +6°C increase until 2100 above the late 20th century baseline, with RCP4.5 at the lower range and RCP8.5 at the upper range (Niang et al., 2014). For the mid-century (2031–2060) mean warming is expected to reach of +2.8°C compared to 1961–1990 (Thornton et al., 2015). Unprecedented climatic conditions may occur both in the Sahel and tropical West Africa as early as 2040. The high level of uncertainty regarding these projections is largely due to low to medium confidence in the robustness of computed future rainfall change, both in amplitude and direction of precipitation signals. Based on earlier CMIP3 GCMs projections, extreme rainfalls over West Africa and the Sahel zone nevertheless would increase until end of the 21st century (low to medium

confidence). Of particular relevance is that Guinea-Bissau's highlands in the East may experience a higher number of days with extreme rainfalls in the monsoon season (Niang et al., 2014).

In general, higher temperatures and a higher frequency of droughts and floods will likely to become more important in the future. Water resources in dry regions such as Guinea-Bissau may be strongly affected by overall rainfall reductions due to higher than average surface drainage sensitivity. There is also evidence for a potential southward shift of the Sahel, Sudan, and Guinean savannah vegetation zones with potentially adverse consequences for the region (Niang et al., 2014). For example, projected changes in potential evapotranspiration (PET) and negative rainfall anomalies for the western Sahel might cause a virtual elimination of the region's growing season by 2041–2060. The western Guinean coastal region itself may suffer a 20% decrease in growing season days, differently to other parts of Africa where increases up to 5-15% can be expected (Cook and Vizy, 2012).

➤ **Curent vulnerability to Climate Change**

Vulnerability to climate change depends on exposure of social systems (e.g. family farmers) or natural systems (e.g. ecosystems) to climatic events, their sensitivity to the (expected) impacts, and their capacity to respond and recuperate after an impact has occurred. These three dimensions – exposure, sensitivity and adaptive capacity – are formed not only by the magnitude and frequency of current or future climatic variability, but also a variety of factors that affect human systems, such as water access, infrastructure, political stability, market access, prices, availability health services etc. (Eakin et al., 2014; IPCC, 2014a; UNFCCC, 2010).

In this context, Guinea-Bissau's National Adaptation Programme of Action (NAPA) (Republic of Guinea-Bissau, 2006) identified the agricultural sector as the most vulnerable to climate change for a number of reasons: it is the dominant component of the GDP, the livelihood for a majority of the poor population depends on agriculture, with climatic change potentially causing significant damage to the sector. With decreases experienced in the duration of the rainy season (now limited to 5 months) and the overall volume of rain having led to a decline in production often associated with water shortage, acute droughts are identified as the most significant risk. However, increased winds and intense rainfall may also lead to loss of production (and stored crops) as well as periodic localized floods, either through destruction of dykes and rice fields or salinity intrusion from the sea. A reduction in the duration of cold periods may exacerbate heat stress on plants and animals. The NAPA further estimates that there has been a 20–30% fall in agricultural production with one third of the population of Guinea-Bissau being threatened by food insecurity. The shortfall in national cereal production, predominantly rice, is expected to rise to 75,000 tons per year, which would increase the need for imports.

Recent scientific evidence from the IPCC AR5 (IPCC, 2014b, 2014c) and other studies confirms this assessment for the West African region, and Guinea-Bissau in particular. Subsistence agriculture and food security are directly vulnerable due to both future, but also existing climatic and non-climatic stressors, such as existing lack of inputs (e.g. lack of irrigation or fertilizer application), infrastructure deficits and weak services. In assessing African corn yield data from 1961 to 2010, Shi and Tao (2014) find that a 1°C average temperature increase reduced corn productivity by >10% for 8 African countries, including Guinea-Bissau. Furthermore, droughts tended to worsen these impacts: a 0.5 decrease in the standardized precipitation evapotranspiration index (SPEI) led to >30% losses in 32 African countries, with Guinea-Bissau again included (Shi and Tao, 2014). Temperature increases may also reduce crop cycle duration and create higher water stress for plants due to higher

evapotranspiration demand, with PET also being a primary constraint on corn water usage in Guinea-Bissau (Estes et al., 2014).

Future median losses in crop yields are estimated at an average –13% for Guinea-Bissau, caused mainly by drier and warmer climate in northern West Africa. Importantly, potentially positive feedback effects for crop yield because of a higher CO₂ fertilization effect may not contribute to higher food security as many West African staple crops (corn, millet, sorghum, with the exception of rice) are C₄ crops which are less sensitive to higher CO₂ concentrations (Roudier et al., 2011). Another recent study projects a decline in sorghum yields in the order of 16–20% by 2031–2060, with agricultural output becoming more and more affected as temperatures increase (Sultan et al., 2014). Potentially higher rainfalls would have only limited impacts under these scenarios: already under a >2°C warming scenario any potentially positive effect on millet and sorghum yields would be cancelled out (Thornton et al., 2015). Livestock is also extremely vulnerable to climate change: under a RCP8.5 high emission scenario Aboveground Net Primary Productivity (ANPP) of the Guinea-Bissau's rangelands could decrease by a mean –87.9% until the 2050s, compared to a 1971–1990 baseline. In fact, of all African countries, only Gambia is projected to suffer higher losses in ANPP, which is closely linked to the profitability and productivity of pasture (Thornton et al., 2015). The incidence of crop and animal diseases or pests is also to be affected by a warming climate, as are climate-related damages to essential infrastructure (roads, storage, communication, electricity supply, etc.) and services (health, etc.), putting considerable additional risks on food security and agricultural production (Niang et al., 2014; Porter et al., 2014).

Further reasons for concern relates to climate change impacts on biodiversity, health, civil conflict and economic costs in the region. Habitat loss, environmental degradation and unsustainable agricultural practices already affect biodiversity and species in West Africa, but under increasing climatic stress amphibians in particular could become very vulnerable in semi-arid Guinea-Bissau (Carr et al, 2014). Higher rainfalls may make cholera collect more frequent in Africa, particularly where it is already endemic (Niang et al., 2014); This again includes Guinea-Bissau. There may also be a link between climatic changes and political stability: Burke and al. (2009) find a significant relationship between the occurrence of armed conflict in sub-Saharan Africa and increasing temperatures. This implies that warmer years would also increase the likelihood of civil conflict. Guinea-Bissau's coup d' état of 1998 has been specifically mentioned in this context (Solow, 2013). Finally, the economic damages caused by climatic change may be huge the national economy: according to a 2013 vulnerability assessment by Verisk Maplecroft (2013) Guinea-Bissau's economy is very vulnerable to economic output losses, second only to Bangladesh at global level.

➤ **Climate change projection**

Several climate models conducted at the national level generally predict a darkened future for the country⁵. These models, developed through the NCCCC and NAPA processes, suggest increased climate variability and climate-change-related shifts in temperature and rainfall in the future in Guinea-Bissau both in the short and long term.

Regarding temperatures, in the short term, ie by 2020, changes are already expected. Data from the country's Second National Communication on Climate Change (SNCCC)⁶ reports that both high and low emissions scenarios for climate models downscaled to Guinea-Bissau predict the average temperature to increase by about 1.0°C to 2020 under the different IPCC scenarios in relation to the average temperatures established for the period 1960-1991 (see Fig 6a high emissions scenario and 6b low emissions scenario). All models predict year increase in national average temperatures of between 1.8 ° C and 3.3 ° C for the lowest and

⁵ These models are ECHAM4, HADCM3, NCAR_PCM, CGCM2, GFDL-R30

⁶ The country's third National Communication on Climate Change is currently in preparation.

highest emission scenarios respectively, relative to 1961-1990 figures (see Figure a and Figure b)⁷.

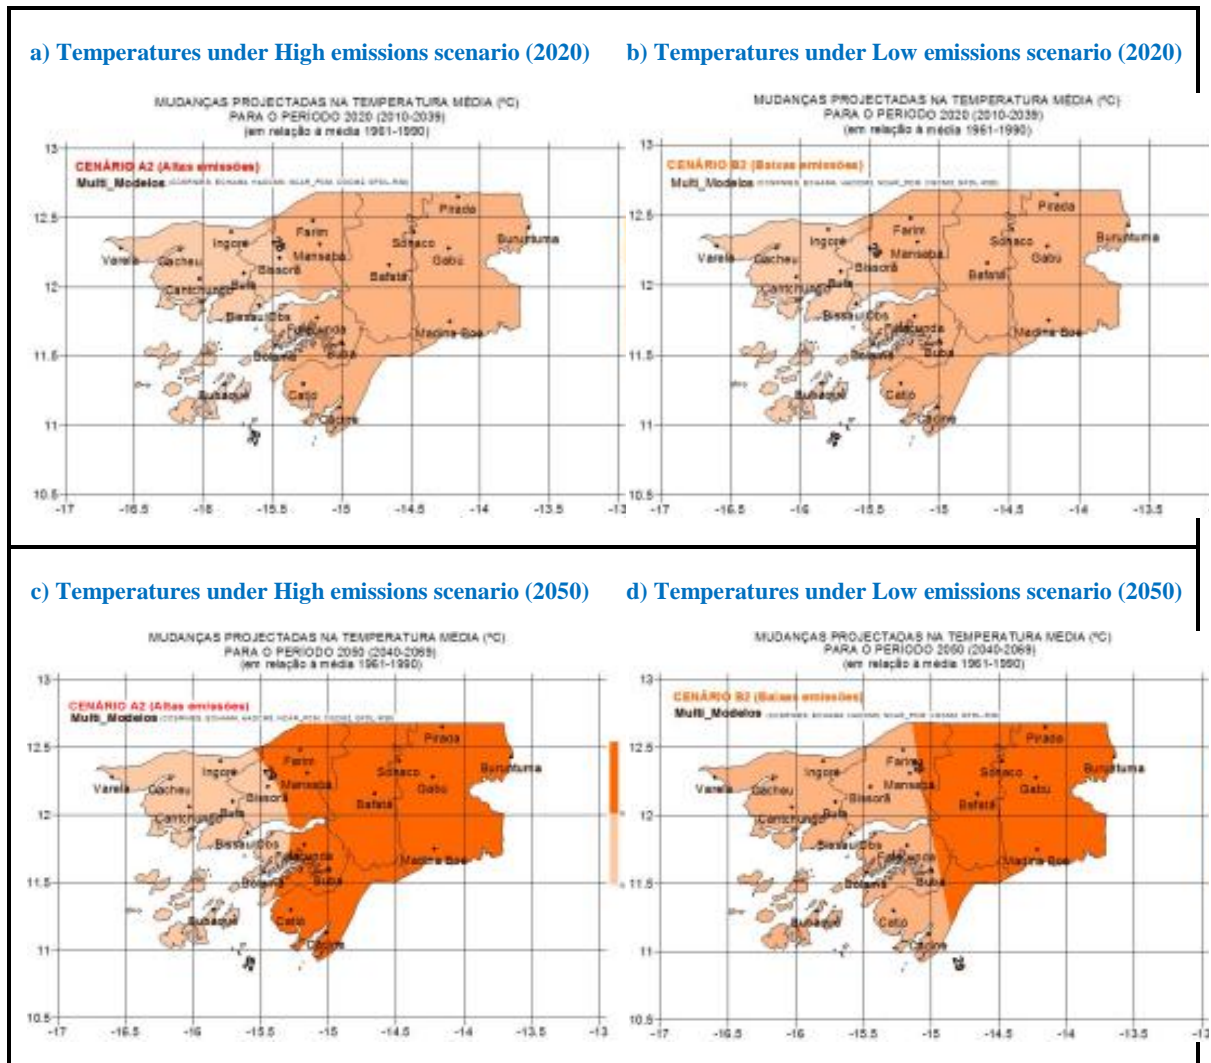

Figure 21: Projected Average Annual Temperatures (°C) to 2020 and 2050, downscaled from multimodels

Regarding rainfall, in by 2020, impacts on rainfall are more uncertain: most of the models expect precipitation to increase across the nation by 3.7-3.8% under future emissions scenarios, although one model shows a decrease in average annual precipitation by 2% (CSIRO) (see Figure 6a and Figure 6b; CSIRO model not shown). However, all the scenarios forecast irregularity in rainfall patterns implying challenges to existing agricultural practice. At the long term, by 2050, most global and regional models predict that the average of the annual rainfall in West Africa will increase by 3.8 - 4.1% in relation to 1961-1990 levels (see Figure 6 and Figure 6 d c), with the notable exception of the CSIRO model, which predicts up to 3.5% decrease in rainfall.

⁷ It should be noted that global emissions are currently higher than those assumed in the highest emission scenario, with implications for temperature increases to be towards, or potentially above, the higher emissions scenarios of the IPCC Fourth Assessment Report.

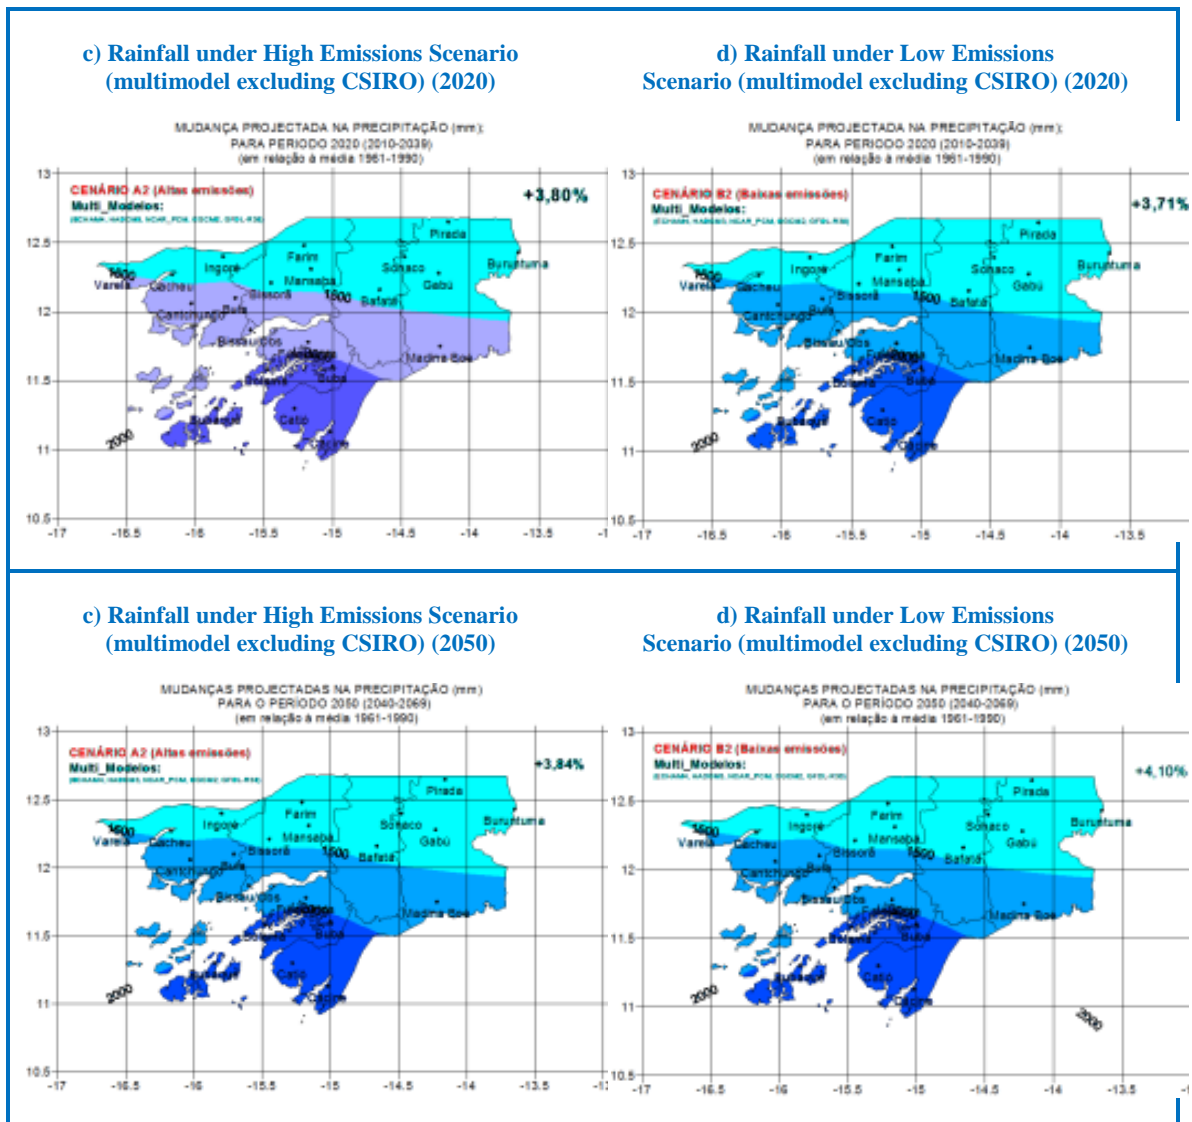

Figure 22: Projected Average Annual Precipitation to 2020 and 2050 downscaled from multimodels

It is important to note the observed precipitation patterns to date have shown a decline in precipitation, whilst most of these models show an increase in precipitation (except for the CSIRO model).

➤ Future vulnerability of surface water resources

Water resources of Guinea Bissau remain vulnerable to the effects of climate change. Datas indicate that the rivers will experience a rate reduction exceeding 50% of the current average in places. This phenomenon of reduction will be common to all parts of the country but very marked for those on the 10th parallel north, which includes upstream of the Niger watershed. It is therefore anticipated that from 2050 to 2100, the rate of decline the Niger watershed in Guinea Bissau from 16 to 28% to the sensitivity of 2.5 ° C and 23-54% sensitivity 4.5 ° C. The main tributaries of the Niger watershed in Guinea Bissau undergo phenomena related firstly to the loss of vegetation cover and soil moisture and secondly to increased water erosion by rainwater and destruction of gallery forests.

➤ Vulnerable socioeconomic groups

In Guinea Bissau, over 80% of the population lives and works in rural areas. The livelihoods of these populations are increasingly degraded. The negative impacts of human activities mismanaged in the country are exacerbated by climatic disturbances reinforcing the degradation and loss of vegetative cover of watersheds, the destruction of natural formations and gallery forests, silting up the beds and plains, the loss of animal and plant species, the decline in soil fertility. So, all socio-economic groups, dependent ecosystems and their resources to meet their subsistence needs, are vulnerable. The most vulnerable group consists of farmers who constitute the occupational layer the largest and poorest. In the hinterland, the decline in rainfall, drought, flooding and strong insolation cause, as appropriate, declining soil fertility and the crop yields, the spread of diseases and pests of plants and animals, water scarcity and increased risk of bush fires. In coastal areas, the intrusion of sea water on the continent causes flooding of rice-growing land and salinization.

Apart from farmers, ranchers and market gardeners are also very vulnerable. For breeders, climate disruptions lead to the depletion of forage species, the depletion of grazing areas, the increase of transhumance, the proliferation of episodic diseases and exacerbation of conflicts between farmers and herders. For gardeners, the decline in soil fertility, water shortage and the resurgence of diseases and enemies of plants are increasingly the cause of a counter performance of gardening.

ADAPTATION NEEDS IN EAST GUINEA-BISSAU

Current coping mechanisms of family farmers in East Guinea-Bissau are inadequate to protect rural livelihoods from increasing climatic stress. Two examples are pastoralism and permanent agriculture: temporary moving of cattle during times of droughts has augmented pressure on water and forest resources elsewhere, and an increasing number of families have reported to suffer violence and robbery while away from their home regions. In agriculture, strong reliance on cashew nuts for family income turns farmers vulnerable because yields have declined and world market prices have become more volatile. In particular, recently falling average cashew prices have increased food insecurity as the exchange rates between rice and cashew changed: instead of receiving 3 kg of rice for 1 kg cashew between 2011 and 2012, farmers

only received 1 kg of rice for 1 kg cashew in 2013 (WFP, 2013). Other coping strategies such as reduced food consumption below nutritional needs, sales of household assets in order to buy cereals, or acquiring rice through high interest loans given by cashew merchants (Temudo and Abrantes, 2014) also affect livelihoods negatively.

The Nairobi Work Plan (UNFCCC, 2010) recognizes the implicit relationship between climatic and social stressors when stating that adaptation can either include climate-proofing of existing socio-economic activities (by integrating future risk) or the expanding of adaptive capacity of activities or systems to deal with increased climatic variability and change. In both cases, potentially critical thresholds in existing climate risk management strategies are modified through adaptation in order to reduce vulnerability to climate change impacts, either via incremental, systemic or transformational changes (UNFCCC, 2010).

In practice, adaptation options for climate-smart agriculture – that is agriculture that sustainably increases productivity, resilience (adaptation), reduces or removes greenhouse gases (GHG) (mitigation), and enhances achievement of national food security and development goals (FAO, 2010) – focuses on practices to build resilience to existing risks and to changes in an evolving climatic and socioeconomic context (Meybeck et al., 2012). In this context, climate-smart agriculture adaptations include a variety of potential actions: implementation of climate forecasts (for crop risk management) or early warning systems, promoting behavioral change (e.g. through promoting efficient water use in times of droughts, or changing of planting dates), improving water access conditions (sustainable use of groundwater resources, increasing water storage capacities, rainwater harvesting, etc.), agricultural development (deficit irrigation, crop rotation practices, short cycle crops, use of drought-resistant seeds, measures to reduce soil erosion, cereal storage facilities or animal traction), livestock management (manure management, improved feeding or grazing management), biodiversity conservation (e.g. agroforestry to improve microclimatic conditions for livestock and to mitigate surface water runoff) or health interventions (FAO, 2010; Niang et al., 2014; Porter et al., 2014; Schaeffer et al., 2013; Thornton et al., 2015; UNFCCC, 2010).

In dryland regions adaptations are often autonomous and reactive to short-term motivations (Niang et al., 2014). However, in the context of Guinea-Bissau's resource-poor family farmers it is clear that few families have the opportunity uptake any set of more ambitious adaptation options mentioned above. Welfare and off-farm income have been identified as important indicators for autonomous adaptation (Thornton et al., 2015); both conditions which are notably absent in the majority of East Guinea-Bissau farmers. Other constraints for the adoption of adaptation options that increase the resilience or diversity of agricultural systems, or enhance food security and climate risk management are also frequent. For example, weather information for crop and livestock management may be unreliable or inaccessible, while improved feeding may prove as too costly for farmers (Thornton et al., 2015).

Supporting family farmer families in East Guinea-Bissau through strengthening of climate-smart agricultural practices may thus provide important benefits, both in terms of sustainable livelihoods and resilience to climate change. At the same time, delaying broader adaptation approaches is likely to increase overall costs in the future and lead to higher levels of vulnerability of the affected communities (Schaeffer et al., 2013; UNFCCC, 2010). Many LDCs, including Guinea-Bissau, have now developed their National Adaptation Programmes of Action to Climate Change (NAPAs) which identify priority adaptation projects. Next to climatic risk, these priority measures also address immediate social and environmental needs of communities. In this context, the UNFCCC has adamant in urging LDCs to carry out these projects soon as possible (UNFCCC, 2010).

In the past decade, Guinea-Bissau has reduced important information and data knowledge gaps required for impact, vulnerability and adaptation assessment. Positive contributions have come from the GEF/UNDP project "[Strengthening adaptive capacity and resilience to Climate](#)

[Change in the Agrarian and Water Resources Sectors in Guinea-Bissau](#)” (00077229) (LDCF) which has started climate-smart agriculture pilot initiatives in 14 tabancas of the Gabú ‘region’. In this context, the present project proposes to scale-up identified climate-smart agriculture practices in East Guinea-Bissau, using the GEF/UNDP project as a starting point for mainstreaming adaptation into development planning and institutional capacity building.

SUMMARY OF THE RESULTS OF LESSONS LEARNED STUDY FROM THE LDCF PROJECT

So to avoid past mistakes and improve the performance of the new project, a study on the lessons learned from the project "Strengthening Climate Change Adaptation and Resilience in the Agrarian and Water Resources Sectors in Guinea-Bissau" (00077229) was conducted during the preparation of the full project. The objective of this study is to identify and analyze the relevant lessons learned from the GEF/UNDP LDCF project implementation, in order to support the Full Proposal development of the "Scaling up climate-smart agriculture in East Guinea Bissau" (GNB/RIE/Agri/2015/1). Specifically, the study aims to respond to these two questions raised by PCN reviewers of the Adaptation Fund Secretariat:

- Question 1: What have been the main achievements of the LDCF funded project at the end of the project, and has its implementation has resulted in opportunities to achieve higher cost-efficiency in the investments in the proposed project; and
- Question 2: How will the project make use of the lessons learned and best practices from the LDCF project?

Within the context of these questions, the lessons learned include the "identification and analysis of constraints, opportunities, and approaches to be considered for the new Adaptation Fund Full Project, focusing on all relevant aspects (technical, environmental and social, organizational, institutional, legal, financial, etc.) that enabled the implementation of project activities and the achievement of the expected results under the LDCF project".

Furthermore included are descriptions of best practices for adaptation to climate change in the Gabú LDCF project region, focusing on projects that have proven their adaptability to adverse effects of climate change and climate variability, soil management and appropriate management of pesticides.

This study on lessons learned is undertaken in support of the Full Proposal development of the project "Scaling up climate-smart agriculture in East Guinea Bissau" (GNB/RIE/Agri/2015/1). This report aims to answer the two questions below. It does neither constitute a final evaluation of the LDCF project nor a M&E report of climate-smart agriculture projects, and therefore does not give a complete validation of the project's development strategy or its intervention logic. Instead, this study can be seen as a rapid assessment of the LDCF project, based on a review of the project documents made available, a limited number of semi-structured interviews with the project team, and participant observation in short field visits.

Particular focus of this study is on responding to these two questions: (1) what worked in the project; and (2) what could be improved in the project. These questions are responded to both in terms of project design and formulation and at the project implementation level.

The summary of the report's findings are presented below (the detail report is presented in annex 3).

Quality and pertinence of the project process formulation:

The LDCF project was found to have a clearly defined institutional mechanisms and a logical theory of change. There are real doubts whether the LDCF field interventions are sufficient to turn agro-pastoralist production systems resilient against climatic stress, as well as whether the activities are sufficient to improve the participants' livelihoods. In particular, biodiversity services and pastoralists needs should be considered to a higher degree in order to contribute to vulnerability re-duction in both Bafatá and Gabú regions.

Project indicators for the Adaptation Fund project proposal need to be designed more carefully in order allow for consistent M&E of the project.

Project relevance to the political context of Guinea-Bissau:

The LDCF project supported the relevant government policies and plans, including the country's Poverty Reduction Strategy (2011-2015) and NAPA priorities. But identification of project initiatives outside the government sphere had been insufficient, as remarked in the ongoing Adaptation Fund project review process. Therefore it is suggested that a thorough review of relevant projects in the project area should be undertaken for the Adaptation Fund full project proposal development in order to identify overlaps and possibilities for collaboration, including actors from international institutions and NGOs/CSOs. Part of this review has been done during Project Concept Note development, but should be updated at project start.

Risk management:

Identified risks and risk hypotheses were relevant and clearly identified, and risk management was appropriate under the circumstances. The Adaptation Fund project should update risk hypotheses from the LDCF project.

A continuous risk assessment system should be implemented in order to systematically identify and assess risks during project implementation, according to type (environmental, financial, operational, political, regulatory or policy), level (standard or critical), response category (emergency plan, monitoring or other), changes in risk (mitigated, stable, increasing, problem) and date of risk identification. Risks should be identified at local (field intervention), national (project lead unit) and communication between both levels.

Given that the scale and complexity of the Adaptation Fund project will increase compared to the LDCF project (geographically and in terms of financial resources) it is recommended that the project hires a specific technical expert (or team of experts) with proven expertise in risk management which would also improve building capacities in adaptive management in the project.

Project management structures and contribution to effective and efficient project development:

Overall, work management structures and PTAs (Annual Work Plan) were judged to be of good quality. However, the Project Steering Committee (PSC) did not have the role laid out in the PRODOC regarding LDCF project implementation and strategic guidance. These mechanisms should be redesigned for the Adaptation Fund project given the delays caused by this.

Training of the project team in technical, participatory processes, and project management should receive more attention from the start of the project to allow better serve beneficiaries. Project Management Unit personnel for the Adaptation Fund project should be recruited by call of application, should have experiences on the field in the project actions. Their technical capacities should be enhanced on adaptation, fiduciary, environment, social and gender standards.

Functionality of project partnerships established:

The LDCF project established relevant partnerships with national partners (through six partnership protocols) and regional and local government, but the agreements did not always result in concrete action by partners. Agreements should be maintained and strengthened where necessary. Partnerships with CBOs should be broadened in the new project in order to ensure sustainability and a more effective replication and diffusion of activities and results. In this work with CBOs and NGOs will require strict supervision from the project team, both in

technical and financial terms.

A positive example has been social mobilization through the Rural Climate Change Forum.

Adequacy of monitoring and evaluation mechanisms:

Monitoring and evaluation indicators were identified in the PRODOC. However, neither a socioeconomic and agroclimatic baseline (project start) nor a follow-up monitoring of interventions was undertaken. Because of this the contribution of the project to local (community) vulnerability reduction is impossible to verify. This is a clear 'information deficit'. As a consequence local interventions seem to have been decided upon largely through ad-hoc decisions by the technical team, but not scientific evidence. This 'information deficit' has two direct impacts: it (1) affects the capacity to obtain further financing in the future as positive impacts on livelihoods and vulnerability reduction by the interventions cannot be proven; and (2) field interventions are implemented without an empirically validated scientific evidence basis. It is therefore strongly recommended to develop a representative reference/baseline dataset and M&E system which covers relevant socioeconomic, environmental and agroclimatic data for both Bafatá and Gabú regions. M&E should include both possible participants and non-interventions groups in order to allow comparisons in productivity, resilience (adaptation), reduction or removal of greenhouse gases (GHG) (mitigation), and enhancing achievement of national food security and development goals. The data collected should be supported by existing/updated agroclimatic zoning information for both regions. This activity needs to be carried out at the start of the contract before field activities are carried out. The hiring of a dedicated international team of experts to develop this work is also strongly recommended, if possible in collaboration with national partners from university in order to build research capacity in Guinea-Bissau. This cooperation should also include BOAD and UNDP Guinea-Bissau as a key supporting actors.

Gender and equity dimensions have been incorporated into project activities relatively strong, but efforts should be made to better communicate links between discussions with women, their opinions, the activities developed together with them and possible outcomes, and the evaluation by women. Gender aspects should specifically also be incorporated into the M&E system. Gender sensitivity of community forest protection should be studied more closely, given that male household members are largely responsible for slash-and-burn agriculture.

Effectiveness of project implementation:

Actions for agriculture have been implemented not in integrated development approach, but in a dissated and unconnected manner at the village level. This should be altered towards a more integrated approach in a new project (see below). Actions for livestock and pastoralists have been extremely limited in face of the challenges faced by the sector. Water infrastructure needs to be better integrated into the subproject development at village level. Assigning a field coordinator (not existent in ongoing LDCF project) may also be necessary to fully coordinate field interventions.

Cost-effectiveness relationship of project in terms of time and budget:

Overall cost-effectiveness has been judged positively in mid-term evaluation, despite low overall density of subprojects in the field. Given the higher number of participating tabancas in Gabú and a high number of tabancas in Bafatá from the beginning on it is believed that the cost-effectiveness of the new Adaptation Fund project would be higher.

Project contribution to building of adaptive capacities of the beneficiaries:

The targeted population has been reached by the project, but it is recommended to allocate more resources to field interventions. Beneficiary selection should be based on stringent

criteria to avoid mis-selection of ineligible candidates for subprojects.

On the relevance of integrating climate-smart pastoralism activities: Pastoral systems occupy large areas in Gabú in Bafatá regions under alarming land degradation and desertification rates. They are culturally, socially and economically appropriate for maintaining the well-being of dryland communities while providing for important ecosystem services and wildlife diversity. However, rangelands are becoming less available as local population and agricultural areas expand, with transboundary cattle herd migration becoming increasingly difficult due to stricter border controls. And pastoralism is also vulnerable to climatic change as drought periods and frequency increase in East Guinea-Bissau's regions. In this context, turning pastoralism resilient to climate change is integral to climate-smart agriculture (FAO, 2009). For adaptation and vulnerability reduction, the improvement of grazing practices has immense potential to improve productivity in livestock and agriculture while bettering rural livelihoods and food security, with additional benefits for agriculture via reduced soil compaction or rainfall loss (higher water source replenishment and water holding capacity through reduced surface water run-off and evapotranspiration, which increases water availability also during drought periods). Current planned activities are insufficient to provide these benefits: the LDCF project addressed livestock only through forage production and cattle vaccination. Therefore, the new Adaptation Fund project should include community-based rehabilitation of rangelands (including restoring of organic matter to soils), improved grazing management (including rotational grazing to decrease losses resulting from overgrazing), conversion from cultivation and native vegetation, sowing of legumes and grasses, and building of pastoralist innovation field school example such as in Uganda (FAO, 2011) as integral part of a vulnerability reduction strategy, with added benefits for rural incomes, food security and biodiversity. Pastoralists can be managers of these improved rangelands. This requires a proper work package of activities, including sociological work and technical assistance to herders in order to increase acceptance and knowledge in grazing management. Project coordination efforts would be needed to manage both agricultural and livestock work packages.

Several project activities such as contingency plans were not always found to be effective. These should be redesigned for a new project. Activities to reduce slash-and-burn agriculture and forest fires should be also integrated into the project given their long-term negative impacts on agriculture and livestock.

Sustainability of activities and the impacts achieved by the project, and replication potential:

Overall potential for sustainability is considerable. LDCF activities contribute to the socio-economic development of a region strongly hit by climatic extremes and change, while protecting the region's environmental resources and contribute to recuperation of degraded lands. Project ownership is often high. Communities are involved in all activities, either directly or represented through the RCCF or Environmental Vigilance Committees (CRA). Furthermore local communities were involved in the project design and seeking of solutions from the beginning of the LDCF project.

The project team should continue to seek establish cooperations in order to upscale investments into climate-smart agriculture and pastoralism throughout the project duration.

The new Adaptation Fund project is drafted to correct the weakness and up scale the good experiences of the LDCF project. These corrections and up scalings process refers to new activities in both original tabancas of the ongoing LDCF project and an additional tabancas in the 'regions' of Gabú and Bafatá, with total beneficiary target population for the new project foreseen at approximately 54 000 people⁸ in East Guinea-Bissau.

⁸ The project will develop 1100 hectares of which 100 ha for market gardening. Each household will occupy a plot of 0.25 ha. On average there are 7 people per household.

PROJECT AREA AND BENEFICIARY POPULATION

❖ Project area

The project seeks to scale the LDCF project activities. In this sense, and in order to expand the impact of the actions of the project for sustainable food security of the country, the Bafata region, bordering in the Gabu region in which the LDCF project activities will be put across, was retained. The project area covers the regions of Bafata and Gabu. Gabú region is located to the East of the country and capital is Gabú. It is limited to the North by Senegal.

Gabú region is located to the East of the country and capital is Gabú. She is limited to the North by Senegal, to the West by the Bafata Region, to the South and East by Guinea Conakry. Bafatá region capital is Bafatá and is limited to the North by Senegal, West by the region of Oio, Quinara and Tombali region south and to the East by the region of Gabu. These two regions form the Bissau-Guinean is.

The project will be implemented in the northern parts of these regions in the sectors of Sonaco, Pirada, Pitche, Gabù, Cuntoboel and Ganadu. The southern parts abound of protected areas and corridors of passages of the animals. The following figure shows the demarcation of the area of intervention of the project.

Figure 23: Demarcation of the area of the project

In terms of population, the Gabù and Bafatá regions account for 44.2% of the total population of Guinea Bissau (Gabù, 29.9% and Bafata 19.3%) according to the 2009 general census, ie a total of 406 492 inhabitants. With an annual growth rate of 2.5%, this population would have reached 483191 inhabitants.

In terms of climate, the Bafata and Gabú regions are subject to a Sudanian climate characterized by alternating a short rainy season (June to October) and a long dry season (November to May). The evolution of annual precipitation analyses show that over the past years, there will be a significant decline in rainfall (annual height and number of rainy days). This variability from one year to another and over the months, particularly at the time of the appearance of the first pluieset at the end of the rainy season and the maldistribution of these rains during the cropping cycles, makes random agricultural production. Monthly averages of temperature are substantially constant from one year to the other, and are between 24 ° C and 30 ° C. But, the maximum and minimum reach gaps in Bafatá, averages range from 300 to 390 C for the maxima, with absolute values of the order of 42 – 43 ° C (March - April) and between 15 and 23 ° C for the minima, and absolute values may fall up to 10 - 12 ° C (in December or January). The monthly average humidity is between 46 and 80%. An annual average of 62%.

In terms of soil, one meets tropical ferruginous soil that are generally associated with the breastplate or horizons gravillonnais, located in depth. The terraces are common and can flush, such as break in slope. Also: (i) of the lithosols associated with battleships and rocky outcrops (especially on both sides of the Cocoli); (ii) soil little advanced erosion, associated with battleships and dismantled gravillonaires horizons; (iii) soils little advanced filler, associated with alluvium or colluvium of sorts; and (iv) to George, pseudogley, valleys and depressions hydromorphic soils.

This area is marked by the destruction of vegetation cover by inversions, fires, shifting cultivation and exposure of the surface to the Sun and the rain. Reducing balance and threatens the current fertility of the soil. However, the productivity of the soil depends on the type of culture. Artisanal and industrial wood production is dominated by the domestic timber merchants and a large majority of the timber merchants is of illegal origin, some from neighbouring republics, with some national complicity. Most of the 'native' population directs their forest operations for the production of oil and Palm wine, construction materials, medicinal plants and collection of fruits with hard obsolete techniques, without any problems of rationality and conservation.

Agriculture represents an important value in the local economy. It is the basis of its development. It is mainly practised by most of the working population of these regions (about 80%), a practice necessary for the survival of families. Cultures are practiced in all three major ecological systems: trays, shallows and mangroves (South - Bafatá). Developed speculations are: (i) cereals including rice, which is the main staple food of the population (the rice is consumed by more than 90% of the population), corn, millet and sorghum. (ii) the tubers, (iii) vegetables; and fruits.

Farming is also practiced by most of the population of the regions nationwide family and differentiated according to the type of animals. Chickens are the production of the family, because it is easy to operate. The production of small and large ruminants, is dominated by the Fulani (majority inhabitants of those areas), in extensive form. Gabú region is considered to be the area that has the largest number of cattle, goats and chickens field, followed by the region of Bafata. The two regions hold approximately 66% of the cattle herd of the country.

These regions are confronted with phenomena related to climate changes that affect agricultural production and exacerbate food insecurity. On average 32% of rural households have cited drought / irregularity rains and flooding as the main shock has affected agricultural production and livestock. Food insecurity finds its place and poverty remains the daily. Food insecurity affects 14% of the population in Bafata and 15% to Gabu. Currently more than 70% of the population affected by poverty as, she compared to 64% in 2002. Malnutrition affects 6.8% of the population in these regions and remains higher than the average national which is 5.6%. Households in which the head is a woman or not educated are more vulnerable. To

deal with this situation of food insecurity, households are appeal to a number of survival strategies for food among other things: the reduction of the quantities consumed by adults; less preferred food consumption is also very intense. The reduction of the amount of food eaten during the meal; the reduction in the number of meals per day. These strategies not only to plunge people into a vicious circle where poverty, food insecurity and malnutrition are mutually.

❖ **Areas and villages of intervention**

Field work helped identify likely potential sites to host the project. The following overall criteria allowed to retain a non-exhaustive list of potential sites/villages:

1. Site not located on a reserve of fauna, in a protected and not adjacent to the major corridors of passages of animals area (confers figure 19);
2. Site which development will not cause a displacement of the population
3. Site, including the surrounding villages are identified vulnerable in terms of biophysical, climate and social risks;
4. Site is surrounded by villages of which there are at least 150 to 200 households if the area is between 25 and 50 ha and the less than 200 households if the area goes beyond 50 ha;
5. Not yet receiving similar support site and having not programmed for similar activities;
6. Sites with potential beneficiary villages close to each other in order to make flexible coordination of the actions on the ground and limit the costs associated with the management of the project;
7. Site with potential significant for the development of irrigation and easily convertible;
8. Area known for its strong potential in livestock including cattle with at least 2,000 heads;
9. Area known for its water deficit for feeding of livestock as well as for the consumption of the population;
10. Area which groups and/or the villagers are recognized as active people with a good organization

Based on these criteria, the potential sites presented in the following table were selected in order to predict at this stage different types of infrastructure can be installed as part of the project:

Table 5: Potential Sites and beneficiary villages Identified

Region	Sectors	Sites	Geographic coordinates	Number of villages	Available area (ha)
Gabù	Pitche	Bucuré Boboti	N 12° 20' 09,5" W 13° 42' 58"	5	100
		Copiro	N 12° 20' 33,7" W 13° 54' 42"	10	60
		Sago/Fulamori	N 12° 18' 33,8" W 13° 55' 59,7"	6	80
	Pirada	Soncocunda	N 12° 37' 10,7" W 14° 11' 18,1"	6	150
		Sissaucunda	N 12° 38' 17,5" W 14° 12' 30,6"	4	65
		Durbali	N 12° 20' 30" W 13° 43' 30,8"	3	60
		Sambataco	N 12° 28' 22,3" W 14° 10' 34,1"	7	50
	Gabú	Cumpaghor	N 12° 10' 30,3" W 14° 11' 19,8"	7	100
		Bada	N 12° 18' 37,1" W 14° 11' 19,6"	9	150
	Sonaco	Colicunda	N 12° 23' 49,6" W 14° 21' 02,2"	5	70
Bafatà	Contuboe	Madina Sara	N 12° 26' 14,3" W 14° 36' 42,2"	8	50
		Manatu	N 12° 28' 41,9" W 14° 34' 01,3"	11	120
		Galugada	N 12° 28' 09,4" W 14° 37' 25,5"	5	50
		Sanecunda	N 12° 33' 57,3" W 14° 43' 30,8"	7	60
		Suna Nhamabé	N 12° 27' 23,4" W 14° 46' 59,3"	8	75
	Ganadu	Cuncana	N 12° 21' 11,4" W 14° 43' 33"	3	50
		Pacua	N 12° 24' 07" W 14° 42' 44,3"	5	80
		Cantacunda	N 12° 25' 48,4" W 14° 47' 44,4"	7	150
	Total	6	18		116

To these sites are added sites partially developed under the LDCF project and which the present project plans to scale up. The latter totaled 661,761 ha (see table below).

Table 6: Sites partially developed under LDCF project

Region	Sectors	Sites	Number of villages concerned	Area (ha)
Gabù	Pitche	Bidigor	4	33,875
		Padjama	4	32,128
		Maghai	5	23,55
		Nhauar	7	172,55
		Loco Djeré	1	37,44
		Djiulem/Caufan	9	95,776
	Pirada	Sintchã Bothe	4	52,187
		Cantari	7	40,15
		Nuncadja	5	50,7
		Popodje		
		Cantacunda	7	44,275
		Copa Mangui	9	79,13
Total	2	12	62	661,761

It is to be noted that in the sectors of Pitche and Pirada, new sites have been identified to be developed under the Adadaptation Fund project. The intervention in these two sectors as part of the new project, is justified by the fact that these sectors remain very vulnerable to climate change. According to the report of the joint mission of CILSS, FAO, WFP and the Government Bissau Guinean on evaluating neediness of the harvest 2016/2017 (November 2016), Pitche and Pirada sectors in the Gabù region are characterized by endemic lack of water and are considered structurally at risk of food insecurity and deserve special attention.

At the beginning of the project, a call for submission of subproject will be launched in the predefined area in order to keep a comprehensive list of recipient sites/villages.

❖ Different crops developed in the project intervention area

In the project area, main crops (the most important) and secondary cultures are distinguished. Food crops (rice) and cashew occupy first place followed by vegetables (tomato, pepper, cabbage, pepper, carrot...). In General, all of these cultures are made in association with others except for the cultivation of rice. Vegetables are also practiced but low percentage compared to cereals including rice according to the seasons and the agro climatic and soil conditions.

The speculations can be divided into groups as follows:

- vegetables whose main crops in the project area are: onion, tomato, cabbage, lettuce, squash, okra, melon and carrot. These speculations are mainly produced in the lowlands;

- roots and tubers whose main crops: cassava, sweet potato and potato. They are grown as well in the shallows on the trays;
- legumes consists speculation as groundnuts, cowpea and green beans;
- cereals whose main crops are lowland rice and upland rice, millet, sorghum, maize;
- spices and stimulants including chilli and pepper are the main crops;
- fruit with mango, lemon, banana.

❖ Choice of crops to be promoted

Under the project, the rice will be largment promoted in view of its place in the diet of households (90% of households consume rice). Given its low production for lack of resources to mobilize water irrigation and lack of technical support, households depend strongly on the market to stock up on rice. About 76% of the households depend on markets for access to rice during the peak of the lean season (August), 40% in November, 28% in December and 27% in January. The share of rice in food spending expenditures represents 52.3% for people in severe food insecurity and 29% for populations in moderate food insecurity. At the national level, the country remains heavily dependent on rice imports which were increased from approximately 40,000 tonnes in 2000 to 143.000 tonnes in 2010 (or 50% of the 2010 rice needs). Although the updated information is not available, the share of rice in the cereal deficit remains very high (see figure below). The intensification of this culture will reduce: (i) at the level of households, the dependence of the market; and (ii) at the level of the State, the decline in imports. It will help to make it available to the staple of households and reduce food insecurity and poverty.

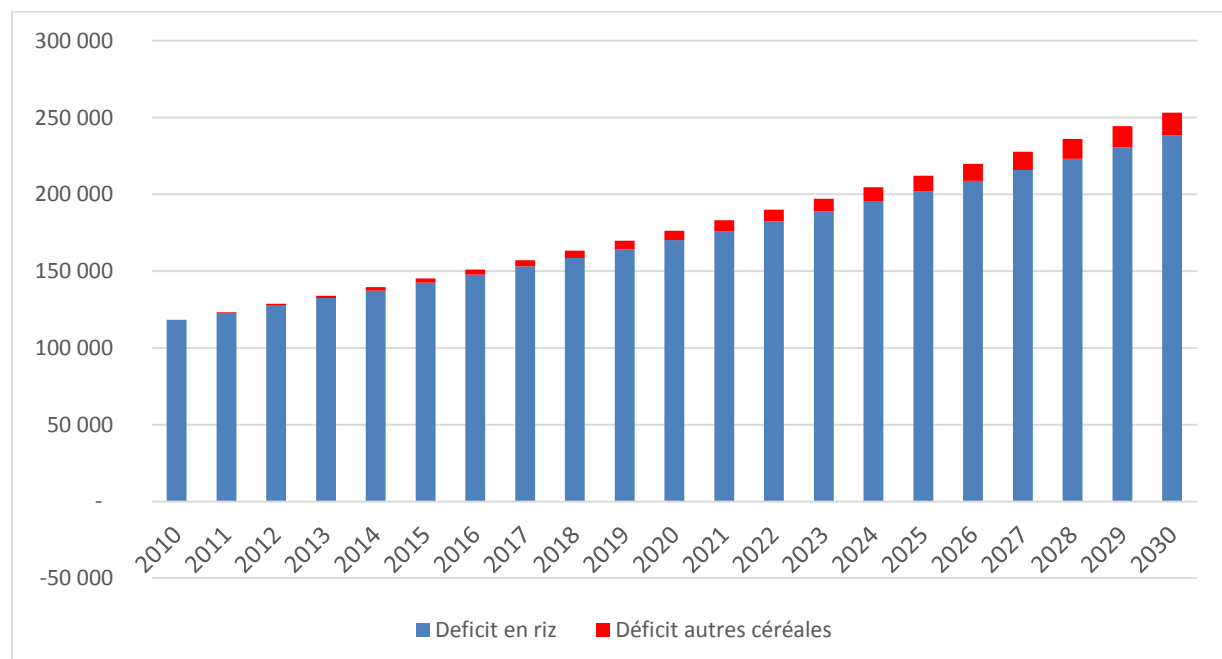

Figure 24: Share of rice in Guinea Bissau cereal deficit

Under the project, 75% of the 1,762 hectares to be developed under the project will be used for rice production (ie 1,320 ha). This choice is made taking into account the place of rice in household food. 90% of the population of Guinea Bissau consumed rice as the main food. The rest of the area (25%) will be destined for gardens namely potato.

As for livestock, 1,000 new hectares of pasture will be enriched with brachiaria and other plants feed, fertilizer and nutrient.

❖ **Beneficiaries population**

The populations of the villages around the selected sites will be the direct beneficiaries of the project. In Guinea Bissau, the women are the most farmers who cultivate rice and work in the gardens field. So, they will be the largest beneficiaries of the project. Beyond the technical and institutional capacity building, the project has:

- The rice production on 1362 hectares. Three (03) groups of 6 people or three households of 6 people will be installed on 1 ha of rice. Eighteen (18) people will thus be beneficiaries of the development of one hectare of rice, ie 24,516 beneficiaries of the 1362 hectares developed under the project
- Vegetable production with potatoes, tomatoes and onions in 400 ha. Seven (07) groups of 6 people or 7 households of 6 people will be installed on 1 ha of landscaped gardens. Forty-two (42) people will thus benefit from the development of one hectare of market gardening, ie 16 800 beneficiaries of the 400 hectares developed under the project.
- The production of forage on 1000 ha pilots. One (01) hectare of pasture pilot will be allocated by group of people or household of breeders of 6 people or 6 000 in all beneficiaries of this activity.
- The drinking water supply for livestock and population from 30 boreholes. Beyond the beneficiaries of the agricultural and livestock activities which are directly fed by the drilling of drinking water, 40 other households of 6 people not involved in the project, so 240 people by drilling water and 7 200 for the 30 boreholes will benefit from This infrastructures.

The following table summarizes the number of beneficiaries of the field activities of the project besides the beneficiaries of actions against bushfires which affect all villages.

Table 7: Number of beneficiaries of the project

Total number of beneficiaries of rice production	24516
Total number of beneficiaries of the vegetable production	16800
Total number of beneficiaries of pasture development	6000
Number of people not involved in the project benefiting from drinking water infrastructure	7200
Total beneficiaries	54516

■ OBJECTIVES OF THE PROJECT / PROGRAM :

List the main project objectives.

List the main objectives of the project/programme.

In the context of extreme vulnerability of family farmers to climate change in dry land East Guinea-Bissau, the overall objective of this project is *to strengthen practices and capacities in climate-smart agriculture in the project region and at institutional level*. Through the project's activities, food security and livelihoods are to be strengthened at household level while simultaneously increasing capacities in climate risk management and adaptation planning at all levels of governance. In particular, the project will solidify and expand the activities of GEF/UNDP-00077229 project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" both in the 14 original tabancas in Gabú 'region' of that project while integrating an additional ~100 tabancas in the 'regions' of both Gabú and Bafatá into the project's scope of action, with a total beneficiary target population of approximately 37,000 people in East Guinea-Bissau.⁹

This ongoing LDCF project (00077229) aims to increase resilience to climate change through both immediate and long-term adaptation measures in development policies, plans, programs, projects and actions. Through outputs organized in three work packages/outcome indicators, the project is to contribute to livelihood security, including agriculture and forest resources, and maintenance of water resources in the face of a changing climate. The three outcome indicators include (1) Climate change risks and adaptation measures integrated into key national policies, plans and programs for water, agriculture and livestock management; (2) Small and medium scale climate change adaptation practices for water, agriculture and livestock management are demonstrated and implemented in the selected region; and (3) Lessons learned and best practices from pilot activities, capacity development initiatives and policy changes are disseminated.

The current project proposal will follow the existing intervention framework closely, putting emphasis on scaling-up successful initiatives and capacity building at all levels of governance.

Key achievements of the GEF/UNDP project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" (00077229) include (i) a first identification assessment of key agencies involved in the management of climate risks; (ii) climate adaptation interventions at community-scale with capacity building, including 622 people trained on climate-resilient agricultural practices (crop rotation, terracing, intercropping, conservation of water and soils, etc.), introduction of three rice short-cycle varieties, introduction of forage crop for animal consumption, installation of 9 demonstration fields, 4 veterinary pharmacies, introduction of improved poultry, goat and sheep breeds (more resilient to heat stress), creation of a cereal bank, implementation of eleven seed banks, construction of eight waterholes and three wells, among other; (iii) implementation of a council on environmental monitoring and development of contingency plans in 10 villages, which were already put to test on the occasion of the recent floods in August-September 2015; (iv) establishment of the Rural Climate Change Forum (RCCF) for the project intervention area, which is composed of 23 members (4 of which female) from 14 villages, including ranchers and farmers; (v) 5 policy documents were been revised with the integration of the dimension of climate change (the Charter of agricultural development policy, the Charter of the policy on livestock, the blueprint for water and sanitation, the document of

the strategy of poverty reduction, the Development Plan of the Gabú Region including the development of Pitche and Pirada plan). In this the current project proposal can thus build on a solid intervention and institutional framework – both regionally and locally – for project implementation and capacity building, as well as build on existing lessons for precise adaptation interventions. This project proposal will solidify and expand upon on the key achievements obtained so far from the existing project.

The project will address key vulnerabilities in agriculture and water resources management, and thus contribute to immediate and longer-term development and resilience needs of extremely vulnerable farmers, with a particular focus on extremely vulnerable groups: women, elderly and children. As such, the project is in line with the recommendations of the UNFCCC Nairobi Work Programme (UNFCCC, 2010) and the best available scientific evidence on climate change impacts, vulnerability and adaptation in agriculture, water resources as well as food security (Niang et al., 2014; Porter et al., 2014).

In accordance with the initial scoping of vulnerability and adaptation needs the three specific objectives of the project are thus:

1. Develop technical and institutional capacity of government and civil society (private sector, local communities, NGOs) to address increasing climatic risk in climate change adaptation planning;
2. Enhance the resilience of existing agricultural productive systems and contribute to the diversification of production, including via implementation of climate-resilient water control and management actions to minimize risks from intense droughts and floods;
3. Promote knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning to other regions of the country, other countries in West Africa and to international climate change negotiations and fora, including the UNFCCC process.

COMPONENTS AND FINANCING OF THE PROJECT/PROGRAM:

Fill in the table presenting the relationships among project components, activities, expected concrete outputs, and the corresponding budgets. If necessary, please refer to the attached instructions for a detailed description of each term.

For the case of a programme, individual components are likely to refer to specific sub-sets of stakeholders, regions and/or sectors that can be addressed through a set of well defined interventions / projects.

Project/Programme Components	Expected Concrete Outputs	Expected Outcomes	Amount (US\$)
1. Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning	1.1.1 Socio-climatic vulnerability assessment for East Guinea-Bissau	1.1 Technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions enhanced	0.7M
	1.1.2 Assessment of technical capacity building needs of ministries and field operatives for adaptation planning		
	1.1.3 Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources		
	1.2.1 Technical trainings on adaptative systems and organizational capacity building for identified target groups	1.2 Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, environmental, social and gender in practice (on-site) and adaptation planning	
	1.2.2 Technical assistance and rural extension for subprojects		
	1.2.3 Formulation/Update of contingency plans for climate-risk management		
	1.2.4 Support for famers groups by the government technical experts for adaptation actions implementation		
1.2.5 Capacity building to prevent forest fires			
2. Enhance the resilience of existing agricultural productive systems, including water control and management measures	2.1.1 Development of lowlands to maintain agricultural production in drought periods	2.1 Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security	7.55M
	2.1.2 Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply		
	2.1.3 Rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs, machinery and tools		

	2.1.4 Construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development		
3. Knowledge management of lessons learned on climate-smart agriculture and adaptation planning	3.1.1 Knowledge management strategy developed	3.1 Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries	0.150M
	3.1.2 Project website developed and active		
	3.1.3 Manual and other materials on best practices and measures for climate-smart agriculture are developed		
	3.1.4 Dissemination of results to other regions of Guinea-Bissau and West Africa		
5. Project/Programme Execution cost			0.798M
6. Total Project/Programme Cost			9.198M
7. Project/Programme Cycle Management Fee charged by the Implementing Entity (if applicable)			0.781M
Amount of Financing Requested			9.979 M

Projected Calendar:

Indicate the dates of the following milestones for the proposed project/programme

Milestones	Expected Dates
Start of Project/Programme Implementation	August 2017
Mid-term Review (if planned)	June 2020
Project/Programme Closing	June 2022
Terminal Evaluation	December 2022

PART II: PROJECT / PROGRAMME JUSTIFICATION

- A. Describe the project / programme components, particularly focusing on the concrete adaptation activities of the project, and how these activities contribute to climate resilience. For the case of a programme, show how the combination of individual projects will contribute to the overall increase in resilience.

Component 1: Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning

Guinea Bissau has challenges in terms of the amount and quality of data and information as well as technical capacity to implement climate change adaptation. Despite progress through NAPA development, and an increasing number of scientific studies (see review in introductory section), important gaps remain with regards to climate impacts, socio-climatic vulnerability, and effectiveness of climate adaptation actions and planning. In this context, the project proposes a component for building technical and institutional capacity for climate change adaptation planning; both long-term perspectives on adaptive capacity building/policy development and near-term climatic risk management. Particularly this will include participative development of on-site agricultural and water-management adaptation actions and the development of contingency plans (e.g. flood protection) for climate-risk management. A further focus will lie on the strengthening of interactions between relevant actors for climate change adaptation: government, meteorological services, agriculture sector, research institutions, regional and national government, and the media and local and indigenous communities.

The expected outcomes of Component 1 include (i) technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions is increased; and (ii) farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning. Both outcomes build upon the experiences from GEF/UNDP-00077229 project; therefore the planned capacity building modules will require mainly adequation of existing practices from that project, but not the design and implementation of entirely new modules.

Outcome 1.1.: Technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions is increased

In terms of component outcomes technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions is to be increased, while the target groups will be able to plan and implement climate-smart agricultural practices in the project region.

Output 1.1.1. Socio-climatic vulnerability assessment for East Guinea-Bissau

One of the outputs of the component 1 include an assessment of socio-climatic vulnerability in order to identify agricultural systems and communities most at risk. This will integrate field interviews, focus group meetings, data collection and intervention assessment compared to non-intervention cases (Chambwera et al., 2014) with medium- to long-term climate change downscaled GCM projections. The identified locations through this vulnerability assessment will form the main target for project interventions, including future possible projects.

The results of this study will help developer guide socio-climatic vulnerability assessment at the local level. The purpose of this guide is to allow a self-assessment of the vulnerability of areas/provinces, villages and households in the face of the climate. This self-assessment should take actions to adapt to the local level. This guide should be simple to use by actors at the level of local and easy to interpret. It will be translated into national and local languages. This guide, once approved, will be broadcast in other parts of the country.

Output 1.1.2. Assessment of technical capacity building needs of ministries and field operatives for adaptation planning

To further raise the technical capacity of the main governmental organizations involved, a training needs assessment will be carried out to identify required capacity developments for effective and efficient implementation of the project and adaptation planning capacity, with a focus on climate resilience in the agricultural and water sectors. This assessment will identify the specific needs of specific groups at both ministerial (Bissau) and field-level (regional governments, extension workers), and will be implemented through a range of technical training events. Possible topics are based on key identified vulnerabilities, may include: water management, control and conservation; best practices in climate-smart agriculture; basic GIS training for use in planning project interventions. The needs assessment will also consider possible linkages between traditional knowledge and scientific knowledge.

Output 1.1.3. Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources

This activity concerns: (i) formulation of detailed intervention plan, (ii) formulation/update of policies, procedures and guidelines related to climate, and (iii) Development of monitoring and evaluation system document.

a. Formulation of detailed intervention plan

Once capacity has been enhanced, a detailed intervention plan will be developed across all those sectors involved. This will outline the key vulnerable locations, the proposed interventions on a site-by-site basis, the institutional framework and the lines of reporting and responsible contacts.

b. Formulation/update of policies, procedures and guidelines related to climate change

In order to prevent a possible lack of national policies and legislation on environmental and climate change adaptation needs, gender and natural resources sustainable management, the project will help to improve or develop, validate and approve national policies, procedures and guidelines to address these issues.

With regard to policies and plans, the project will proceed to the revision of the political forest management in the Bafata Regional Development Plan and development plans of the areas of intervention of the project, including the sectors of Sonaco, Contuboel and Ganadu. It will be introduced in these documents the problem of climate change and adaptation strategies with short, medium and long term actions.

With regard to the standards and guidelines, the actions to be taken include:

- Developpement/enhancing of guidelines on dams' security, people involuntary resettlement, land use, forest management, pest management, indigenous people, natural habitat, physical cultural resources, public participation in environmental impact assessment process and gender mainstreaming, pest and pesticides management.

The project will also help to develop certain principles of the Adaptation Fund namely: Equity and access, Gender Equity and Women's Empowerment, Marginalized and Vulnerable Groups;

- Preparation of national and local guidelines on the integration of the climate in sectoral policies as well as in projects/programs;
- Organization of workshops for the adoption of standards and guidelines;
- Dissemination of the standards and guidelines;
- Follow-up of the internalization and application of these standards and guidelines at the local and national level;

c. Development of monitoring and evaluation system document

A monitoring system will be developed through independent consultation. The consultant will be recruited to support the project team to the implementation of an effective system of monitoring and evaluation of the project. This system will include the ongoing assessment of adaptive actions on the sites and the reporting.

To allow the Project Management Unit to do a good project risk continuous monitoring and evaluation (political, strategic, financial, environmental and social, cultural risks, etc.), the capacity of the team will be enhanced on adaptation, fiduciary, environment, social and gender, etc. standards.

Outcome 1.2 Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, environmental, social and gender in practice (on-site) and adaptation planning

The following activities are planned to meet this outcome: (i) technical trainings and organizational capacity building for identified target groups ; (ii) technical assistance and rural extension for subprojects ; (iii) update of contingency plans for climate-risk management ; (iv) support for farmers groups by the government technical experts for adaptation actions implementation; (v) capacity building to prevent forest fires.

Output 1.2.1 Technical trainings on adaptive systems and organizational capacity building for NGOs and identified target groups

a) Training of NGOs for producers technical and organizational support

According to available information, an experiment was carried out in Guinea Bissau in the Gabù region through a rural development project in Eastern Guinea Bissau. The project was closed in 1996. It included a pesticide, fertilizer and agricultural equipment management activity. During that time, only the executives of the State were responsible for the implementation of the project. No NGO was involved in the management of agricultural inputs and equipment. With the relocation of documents in the ministries and movements of the state executives, no trace is found of the reports of the said project. In addition, NGOs organization and participation was missing in the LDCF project, which represents one of the project weaknesses. The present Adaptation Fund project wants to correct the weakness by putting in place a good organization. Given that no concrete experience has been achieved in the field at national level to serve as an example, training will be organized for local NGOs to build capacity to support beneficiaries in the implementation of the project. This training will allow

the NGO that are recruited by call for candidacy between the NGOs trained, to ensure better organization of the producers in management committees as well as an autonomy of these committees to effectively carry out their mission after the closure of the project.

b) Strengthening the technical capacity of producer groups

Technical trainings for identified target groups in topics related to climate-smart agriculture will be conducted.

The project will organize for the farmer's groups, practical training on various topics. In this sense the producers will be trained on the following agricultural practices:

- The Zai technique, a technique that allows to retrieve soil degradation;
- The transversal tillage, a technique that limits the flow of water losses;
- Rotation and association of cultures;
- Management of water and infrastructures of irrigation;
- New system of intensive production of rice (SRI);
- Fertilizer and pesticides use;
- Management of pastures;
- Seed multiplication;
- Etc.

Training will be organized in the intervention areas. These courses will be in the first and second year of project start. An evaluation is conducted at the end of training to measure the degree of assimilation of beneficiary groups. These courses should lead to the establishment, in every village or planning area, management committees. The various training courses will be implemented by government and non-governmental actors. Good practice guides or manuals will be designed in the form of box of tools. The local languages (creole, Mandinga and Peulh) will be used according to the village, for a better understanding by farmers and for a greater ownership of the shares.

c) Strengthening the organizational capacity of beneficiaries

During the consultation phase, the farmers have expressed the need to strengthen their organizational capacity for better management of the adaptive actions. In this context, the project will seek to better organize the beneficiaries to develop and focus on interactions with organizations and farmers groups with villages at which management is often too heavy. Women, youth and men already working individually on the areas planned for development will be encouraged to organize themselves into groups. Capacities building will focus on: (i) the establishment of farm groups, (ii) management and operation of groups; (iii) the technical, organizational and financial groups.

The NGO trained and recruited by the PMU will organize the beneficiaries in management committees and build the capacities of the members to carry out their various missions. The committees will be:

- the Perimeters management committees with four subcommittees: (i) the Seed subcommittee, (ii) the Plowing subcommittee, (iii) the Irrigation Infrastructure Management subcommittee, and (iv) the Fertilizers and pesticides subcommittee;
- the Management committees of the water works to supply water to population and livestock;
- the Pasture Management Committee.

d. Strengthening technical capacities on integrated pest and pesticide management

The project will organize capacity-building sessions on integrated pest and pesticides management for actors involved in the project. **The capacity building will be focused on alternatives to pesticides as agronomic, cultural, mechanical and biological control. These are the techniques or actions that are taken into account in crop development to prevent pest outbreaks and avoid or greatly reduce the use of chemical pesticides (alternatives of chemical pesticides use are presented in integrated pest management approach at the page 123 of this document).** The capacities building on integrated pest and pesticides management will concern at least the following institutions and individuals: Regional Directorate for Plant Protection, **National committee of pest and pesticide management (CNGP in French)¹⁰**; Regional Directorate for Environment and Sustainable Development, Regional Directorate for Agriculture, Regional Directorate for agriculture water infrastructures management, representative of the Governorate of the Region, Competent Authority for Environmental Assessment (AAAC in French) , Regional Directorate for Public Health, National Laboratory for Agrarian Research (INPA in French), Members of Perimeters' Management Committee, NGO's representatives in charge of the supervision of the beneficiaries on sites, the PMU and the presidents and administrators of the perimeters will be trained on the integrated management of pests and pesticides-

This training will be conducted by an **Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries. This expert will be recruited by the PMU under the supervision of the Implementing Entity on the basis of a shortlist of Experts recommended by the FAO office based in Rome (Italy) and or in West Africa in Accra (Ghana).**

At the end of the training sessions, a box of integrated pests and pesticides management tools will be made available to the beneficiaries, the DPV, the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

Output 1.2.2 Technical assistance and rural extension for subprojects

Technical assistance for implementation of activities of the subprojects will be carried out under this output. The technical assistance integrates sharing, demonstration and implementation of climate-smart agriculture management techniques, including livestock. Particular focus is on training agroforestry and conservation agriculture methods that reduce soil disturbance, focus on retention of crop residues and other surface cover, promote crop rotation and seed control, therefore stabilizing production and income as well as reducing environmental pressures. Small-scale market development and efficient water use will also be included in the training programs. The rural extension team will integrate specialists for each of the project's key areas, including agriculture and water resources.

Field extension officers will furthermore provide to seasonal forecasts to the communities and help farmers to use the information properly to increase productivity and food security.

¹⁰ The National pest and pesticide management committee (CNGP) is set up in Guinea Bissau by the Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations and customs.

Forecasts will be presented before the rainy season, and will include an evaluation of previous seasonal forecast as well as possible harmonization with traditional forecasts. Farmers in each tabanca will be trained in using rain gauges to keep a record of rainfalls to identify possibly changing rainfall patterns in the community, as well as to identify the best possible planting days. The project will also engage in training of young men and female to undertake smaller maintenances of project infrastructure, thus also contributing to local capacity building and empowerment.

Output 1.2.3. Formulation of contingency plans for climate-risk management

The project's contingency plans are planned to cover extreme weather events and their impacts, particularly floods. A general contingency plan will be elaborated for the project. After their validated, the contingency plan will be adapted at each intervention site. 21 contingency plans will be adapted. Each contingency plan will be updated by field extension officers in direct collaboration with each community. Participation of women and other vulnerable community members will be particularly promoted.

The technical capacities for a better operationalization of these contingency plans will be conducted. Two workshops will be organized (one in Gabù and one in Bafatà). This will be done by the Civil Protection Division. They will bring together the local services of the intervention regions, the famers groups and the local administrative authorities.

Output 1.2.4. Support for famers groups for adaptation actions implementation

Participative development of on-site agricultural and water-management adaptation actions, where the precise adaptation strategy choice will be made by the communities themselves – following the example from the World Bank's approach and that of others, which do not specify activities before workshops, NGO projects and a typology list of activities that could be discussed at community level during the project. Adaptation actions will thus be detailed once the project starts.

- Support by the government technical experts

Farmers groups and breeders (men and women) will also be trained on the techniques of production of organic fertilizers and briquettes of excrement of livestock. At least 200 farmers will be trained in this technique. Every breeder will produce on average 1.5 tons of organic fertilizer. This action will reduce the need for chemical fertilizers utilization and the operating costs of the landscaped perimeters.

The project will enhance capacities of the beneficiaries on dissemination and strengthening of climate-smart agriculture practices; risks related to slash-and-burn agriculture management; irrigated agriculture interventions; use of agroforestry methods; crop rotation; soil fertility maintenance and higher soil moisture retention; etc. These activities will be conducted with the support of Agricultural and hydraulic decentralized technical services.

To ensure that the adaptation, environmental and social and gender dimensions are adequately taken into account and thus ensure the implementation of the environmental project and social management plan, it is necessary to strengthen the technical and institutional capacities of the State services which will be involved in the implementation of the project. These include deconcentrated services in charge of the environment, agriculture, livestock, plant protection, forestry, hydraulics. The training workshops will be organized on

site led by the PMU, which has a Climate and Environmental Capacity Building Officer in collaboration with the Competent Environmental Assessment Authority (AAAC). An environmental monitoring program will be established and will focus on monitoring, supervision, mid-term evaluation and annual assessment.

It should be noted that the perimeters development will require the use of pesticides to prevent and control crop pests. These products pose risks to the environment and human health. It is therefore necessary to strengthen the capacities of producers in the application and management of pesticides in order to minimize these risks. In order to do this, the project will first develop a guide to good and manage fertilizers and pesticides. These guides will be elaborated in the first year of the project and will be followed, if necessary, according to the observed changes. Good practice guides or manuals will be designed in the form of box of tools. The local languages (creole, Mandinga and Peulh) will be used according to the village, for a better understanding by farmers and for a greater ownership of the shares. In the second year during which the sites can be developed after construction of the structures, training on good agricultural practices preserving the environment and methods and techniques for managing pests, pesticides and fertilizers will be organized in the areas housing the villages of the project. Thesetraining will focused on: (i) information on the risks and health and safety advice. (ii) basic knowledge on handling and risk management procedures; (iii) the wearing of protection and security equipment; (iv) the risks associated with the transport of pesticides; (v) procedures for handling, loading and unloading; (vi) the storage of pesticides in farm; (vii) the management of packaging and used pesticides; (viii) the management of cases of accidental application of pesticides; (ix) the outline of the process of treatment and operation; (x) health and safety in relation to operations; (xi) the emergency measures and emergency pesticides poisoning; (xii) the maintenance of the equipment. These activities will be conducted by the Plant Protection Service in collaboration with the Competent Environmental Assessment Authority (AAAC).

- Proximity support by site facilitators or animators

To ensure efficiency in the implementation of the adaptation actions of the project, daily support will be provided to the farmers by the project through facilitators or animators¹¹. These animators who have a good command of the promoted farming practices, will be in constant contact with producers in the field to ensure adequate resilient practices implementation. In addition, they will help for collecting data of the project on the sites (the actions taken, the problems occurred, the benefits, the needs for the next step, etc.). These data will be transmitted to the national coordination through the regional technical coordinators for the purposes of the development of quarterly and annual reports. This will allow to measure the degree of adoption practices and progressive appropriation of the promoted resiliences techniques during project implementation.

Output 1.2.5. Capacity building to prevent forest fires

The project will engage in capacity building for rural forest fires; namely in (i) organizing rural fire brigades, (ii) train them to combat forest fires that endanger agricultural production and biodiversity in the project region, (iii) provide them with tools to do so, (iv) sensitize fire brigades on good practices to avoid fire, and (v) train fire brigades to sensitize rural populations

¹¹ These will be recruited in the areas of interventions based on the CV after a call for applications. A total of 15 animators will be supported the producers in the implementation of adaptation actions.

(including coal miners, palm wine producers, hunters, breeders, farmers, etc..) before any drought season on fire risks and good practices to avoid them. This part of the project will include the development and dissemination of simple rules, such as avoiding smoking in forests, good practices for palm wine production (which requires fire) or teaching hunters to build low-risk fires while in the forests. Finally, forest fires will also be covered by the project's contingency plans for climate risk management. The project will also enhanced the capacity of the committees of vigilance of fire at the regional level. Exchanges will be organized between fire vigilance committees to share their experiences in this area. The composition of these committees will be reviewed for active involvement of women.

Still in the sense of contributing to forest protection, the project will organize sensitization for local communities on sustainable management of forest resources. Within the project, it will be organized awareness campaigns to communities based on importance of forests in the fight against climate change and the improvement of their living conditions. The aim is to encourage a strong involvement of local communities in forest management and to help them to become the main actors for forest protection. Indeed, forest resources can not be sustained if rural communities are not directly involved in its management and are not aware of their use and benefits they can derive. The project has, through awareness change operating modes of forest resources. Thus every village will be organized twice a year for an awareness of the people including coal miners, palm wine producers, hunters, breeders, farmers, etc. The sensitization will be conducted by NGOs under the supervision of fire brigades and others services relevant the forest protection. These will be NGOs working in the forest protection and which will be selected on the basis of predefined criteria.

To overcome this output, the technical and organizational capacities of Rural Climate Change Forum (RCCF) and Environmental vigilance committees for better operationalization will be enhanced. Rural Climate Exchange Forum (RCCF) and Environmental Vigilance Committees (CRA in portugese) are committees that have been set up to promote exchanges related respectively to the climate and the environment. These two committees are complementary and trained actors of the sectors of agriculture, water, farming, forestry, representatives of the local population especially vulnerable groups. The RCCF and CRA are platforms for Exchange, sharing of information and experiences in various areas including climate. However, in view of the technical and financial shortcomings, their interventions are very limited. The project includes support to the RCCF and the CRA for their better operationalization.

Component 2: Enhance the resilience of existing agricultural productive systems, including water control and management measures

This component focuses on household-/village-level interventions in climate-smart agriculture practices in order to minimize damages from climatic change and variability, as well as to contribute to agricultural and rural livelihood development. In this, the project is to take advantage of 'windows of opportunity' for adaptation: for example, agriculture in the country is still largely organic, and relies on farmer's own seeds for cultivation. Agro-ecological approaches thus have a high potential, including in national adaptation strategies or policy design. While component #1 serves as a key input for pre-selecting project sites, all field activities of project implementation will be carried out in this component.

Table 8: Simulated mean benefit for different crop management adaptations

Management option	Cultivar adjustment (n=56)	Planting date adjustment (n=19)	Planting date and cultivar adjustment (n=152)	Irrigation optimization (n=17)	Fertilizer optimization (n=10)	Other (n=9)
Benefit (%) from using adaptation	23 (6.8, 35.9)	3 (2.1, 8.3)	17 (9.9, 26.1)	3.2 (2, 8.2)	1 (0.25, 4.8)	6,45 (3.2, 12.8)

Source: Porter et al. (2014). Difference between the yield change from baseline for the adapted and non-adapted cases. N represents the number of estimates used for each adaptation. The numbers in parentheses are the 25th and 75th percentiles.

The table above is taken from the IPCC AR5 chapter on food security and food systems (Porter et al., 2014) and summarizes the mean impact of different adaptation actions on increasing crop yield/reducing climatic impacts on crop yields. While the exact impacts are site-specific, the table shows that small-scale incremental or systemic adaptations such as planting date adjustment and/or cultivar adjustment can be very effective for promoting climate resilience.

With regards to water resources the problems with agricultural water management in dryland East Guinea-Bissau are becoming more severe due to climate change. The problems involve drought (acute and seasonal) as well as inundation and flooding of villages and swamp rice fields due to intense periods of rain. Saline water intrusion (more frequent due to sea level rise) is a potential further problem: it affects the existing rice crop as rice is not halophytic, thus leading to losses or a decline in harvest, but more importantly it can also salinize the soil limiting future production. This process can lead to abandonment of rice paddies, displacement of farmers and their families and threats further mangrove destruction to create new paddies. In summary, different approaches to make water control and management more resilient to the future climate changes are required; from water management techniques to the construction of mini-water retention and small reservoirs to preserve water and agricultural production to drainage dykes and channels to minimize flooding damage on crops and other infrastructure.

Under this component, one outcome is expected.

Outcome 2.1: Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security

Planned interventions will be at the farm, or a small farming community level. All interventions undertaken will focus on principles of climate-smart agriculture, i.e. contributing to productivity, resilience and adaptation, climate change mitigation as well as food security and other development goals.

The project will intervene on sites that are being exploited by the population using traditional techniques. On these sites, rice and vegetable crops, the main ones being potatoes, tomatoes and onions, have traditionally been developed in the rainy season. There is no crop or any activity on these sites in the drought season (see the photos below). These sites are abandoned during the dry season and producers are waiting for the next rainy season for a new agricultural campaign if the conditions permit it. In the case of early flood, the producers lose their site for the crop year and are waiting for the next year.

To avoid the disruption of the activities of the producers in rainy season, the construction of water infrastructure and the perimeter facilities will be made in the dry season. The dry season

covers the period from November to June. During the implementation of the project, the PMU will arrange for companies recruited to carry out the work comply with the farming calendar.

Thus, no expropriation, relocation of producers or disruption of the livelihood activities of the producers will be undertaken. On the contrary, the farmers will benefit from the extension of the areas exploited, the water availability, the improvement of soil quality, the support for the acquisition of quality fertilizers and pesticides and the protection of the areas against silting and flooding to improve crop yields and agriculture production.

State of the sites of the producers in the drought season

This outcome aims to develop among others: (i) 1362 ha of irrigated rice, 400 ha of gardens with potatoe, Tomato, Onion, etc. The production of the rice and vegetables will be used to secured the rice needs for 41 316 persons; (ii) 1000 hectares pilot pasture for 1000 breeders groups of 6 persons or 1,000 families of breeders of 6 persons (i.e 6000 beneficiaries) ; and (ii) 30 drillings for domestic and livestock water supply (1200 other households, i.e 7200 persons, outside the beneficiaries of the irrigation and livestock activities, will benefit these water supply infrastructures).

In fact, Guinea-Bissau's Second National Communication to the UNFCCC (SEAT/DGA and Republic of Guinea-Bissau, 2011) and NAPA (Republic of Guinea-Bissau, 2006) highlight the relevant plans and policies for agricultural development and water resources management, where the construction of small-scale water retention considered as an important adaptation activity to increase resilience of cropping systems. The National Plan of Agricultural Investment (PNIA, 2013) further promotes the adoption of integrated water resources management (IWRM). Existing land use or water management plans (national or regional) currently do not cover downstream harm of small scale water retention. It is frequent that traditional legislation that is not documented but used by the heads of the villages is applied. Identification of environmental conflicts, their mediation or possibilities for compensation are regulated in the Land Law (5/98, 1998) and Water Code (5a-92, 1992). In particular, the Law on Environmental Impact Assessment (EIA) (10/2010) rules that projects with expected significant adverse impacts on the environment do require the application of an EIA. This document needs to provide for a clear analysis of environmental impacts and risks, comparison of alternatives and mitigation action, including in non-technical language.

Downstream harm small-scale water retention are potentially covered through the EIA Law but there are no universal methodologies available per project type that could be applied (see

National Plan on Environmental Management, PNGA). In this background the project will work together with the Service responsible for the hydraulic efficiency of the construction of rural infrastructure as wells and mini-water retention in order to develop respected standards for prevention of downstream harm in Guinea-Bissau. These standards will be based on the environmental and social safeguards, including gender mainstreaming policy, of the West African Development Bank (BOAD) and GEF as well as relevant national environmental and social regulations. Traditional authorities will be involved in projects, not limited to land management.

Based on initial scoping studies (see Part II.H), review of climate change adaptation literature, and lessons learned from project GEF/UNDP-00077229 the following activities of adaptation are currently being considered for implementation:

- Development of lowlands to maintain agricultural production in drought periods ;
- Construction of mini-dams for irrigation of rice and vegetable crops. While these are more 'costly' items and likely not feasible in each and every village, many villagers see this as a potential major improvement in the quality of life. The project will take care that villagers will take ownership of the mini-dams and be sufficiently organized to secure their maintenance;
- Rehabilitation of soil and pasture productivity before planting through agro-hydro management, including small-scale investments into machinery and tools (e.g. tractor, fuel);
- Construction of drillings and ramps for supplying livestock with water. This will take into account development needs while taking extreme climatic conditions into consideration.

Output 2.1.0: Support for subprojects ESIA realization, APD, DAO, supervision and control of works

Each of the sites selected for development will be subject to an environmental and social impact assessment. The environmental and social impact assessments of the subprojects will be conducted by consultants recruited by the PMU. These ESIA's will be conducted in accordance with the Adaptation Fund's ESP. The subproject environmental and social due-diligences are been describe under section III.A.

The project will also provide support for the realization of APD¹², tender documents for the implementation of the project and supervision activities for sites development works. The control of the site development work will be entrusted to a specialized Company/Consultant, following a call for applications on the basis of a shortlist. The Terms of Reference will be prepared by the PMU and validated by the implementing entity (BOAD). Supervision will be provided by the PMU, which will report to the BOAD. The BOAD will carry out a field mission to ensure the proper execution of the works of sites development and water infrastructures.

Output 2.1.1: Development of lowlands to maintain agricultural production in drought periods

This activity concerns: (i) Development of lowlands in the framework of the adaptation fund project; and (ii) Scaling up of partially developed sites within the old LDCF project.

2.1.1.1. Development of lowlands in the framework of the adaptation fund project

¹² Etudes d'Avant Projet détaillées in french.

There is two type of lowlands in the framework of the adaptation fund project: the lowlands in the downstream of the micro dams which will be built to control the flood and to maintain water need of the vegetables in drought periods and the simple lowlands without micro dams on which the planning will help to evacuate the excess water in rainy season and control silting. This type of development consists of: (i) the construction of dikes; (ii) the Dikes for protection against erosive action; and (iii) work related to the Protection of the slopes against silting. For this type of simple development, rice is irrigated by flooding plots through dikes and bunds constructed along contour level. The land is carefully leveled at the level of each parcel which size does not exceed 250m². The different components are:

- **Dikes**, which have the function to allow an early water supply of the portions, ensure the necessary level of water storage and the independent management of the water used for irrigation in the different portions of the same perimeter. These dikes are placed perpendicularly to the direction of the water flow and are confectioned with and important component of clay in order to obtain a good constancy and resist the water flow and infiltration;
- **Dikes for protection against erosive action**, which have the functions of impeding the sand that results from the continuous erosive process in the lateral slopes from arriving to the valley, contributing to the conservation of the physical characteristics of the soils in the valley and contributing to the reduction of the silting up by weeds. They are placed in margins of the perimeter and in the separation between the slope and the valley. The trenches that result from the excavation upstream from these dikes will collect and conduct runoff water from the hydrographic basin to the collectors or drainage channels, equipped with a discharge structure every 200 m, in cases where there aren't thalwegs/affluent, for this purpose. These dikes are positioned perpendicularly to the direction of the water flow and are confectioned with and important component of clay in order to obtain a good constancy and resist the flow and infiltration. The materials and working conditions must be determined in a way that enables the construction of homogenous layers of a maximum thickness of 20 cm, spread, moisturized and compacted, completely in each layer;
- **Downstream water regulation channels**: Channels will be built to direct continuously the water to the downstream.
- **Protection of the slopes against silting**: The silting up of valleys by sand is part of the problems for the development of the production of rice. It contributes to the reduction of the capacity of the soil to retain water, in changes in its physical structures and productivity. The protection of slopes has become more and more a requirement for the conservation of valleys. This project will include activities for the ordering or improvement of the surrounding slopes of the rice production perimeter in order to avoid, in long term, the silting up by sand. The actions will consist of the creation of a green coverage area of specific trees, of at least 30 m of width per plantation (fruit trees, medicinal trees, service woods, firewood, forage plants, nutritional plants such as Moringa). The implementation of these activities could be entrusted to the beneficiaries under the technical supervision of the Directorate General of Water and Forests. The Project, through this Directorate General, would be responsible for supplying seedlings and monitoring the reforestation process.

A total of 1000 hectares of lowlands will be developed. The technical characteristics of the structures, the details of construction and the type of hydraulic infrastructure required for the development will be defined based on detailed hydrological and hydraulic studies.

2.1.1.2. Scaling up of partially developed sites within the LDCF project

As part of the LDCF project, micro dams was built (see figure below).

Partial view of micro dam (with a downstream water drainage channel) built in Bajocunda at the end of 2016 to control flood and used like a bridge

14 sites making up 662 ha were partially ordered.

Partially ordered lowlands within the LDCF project

However the exploitation of the ordered areas was hampered by the lack of internal ordering of the improved perimeters. The interventions in these sites will consist of (i) ordering of the perimeters through the construction of portioning dikes and irrigation channels and; (ii) protection of the improved perimeters against the silting by sand.

- **Portioning of the perimeters:** Will consist of ordering the portions of 250 m², isolating and transporting the irrigation water of the plantations. The portioning dikes will have the function of facilitating the retention, the distribution and management of the irrigation water in the portions, slowing down the rainfall water runoff, ensure and regulate the water levels in the portions and enable the independent management among the portions.
- **Protection of the slopes against silting:** this activity will be carried out as described under the item 2.1.1.1.

Downstream water regulation channels are built with the micro-dam to direct continuously the water to the downstream.

Output 2.1.2: Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply

To combat flood and drought, micro dams for water storage will be constructed to preserve water, by sustainable manner, within the agricultural systems. The micro dams will be built on selected low lands under flood prone areas. The constructions will use simple technology. This will ensure that the project beneficiaries (local farmers) are able to manage post-project repairs and maintenance after the project is completed. In addition to these water storage facilities, simple irrigation systems will be designed to maintain the required moisture level in the fields/paddies. The infrastructures design will ensure an appropriate spreading of the water on the surfaces (plots) to ensure the development of the crops and improve yield.

A total of 20 micro-dams will be built. The technical characteristics of the structures, the details of construction and the type of hydraulic infrastructure required for the development will be defined based on a detailed hydrological and hydraulic studies.

2.1.2.1: Construction of micro-dams

Taking into consideration the characteristics of the potential sites pre-selected during the preliminary field studies, these infrastructures will be used to promote: irrigation and livestock water supply.

The infrastructures consists of: (i) the retention dikes construction; (ii) the excavation of the basin; (iii) Protection of the slopes against silting.

- **Retention dikes:** These are hydraulic structures that will have two main functions, which are (i) retaining water and flooding the portions of rice production upstream and (ii) serve as a roadway for the connection of two or more located on the margins of the valley. The landfill for the retention dike will result from the excavation of the irrigation channel, placed in layers to create this dike. These dikes are built with an important component of clay in order to obtain a good constancy and resist the flow and infiltration. They will be compacted manually, in a way the enables them to resist the pressure exerted by the water flow. They must be installed perpendicularly to the runoff water flow direction, that is, perpendicularly to the collector. The exact position and shape of construction will be determined during the execution by the beneficiary, with the assistance of a technician/topographer. For retention dikes that will also serve as a roadway the landfill material will be lateritic clay and may, eventually, have a clay nucleus and its landfill must be compacted, with the help of machinery, at 90% Optimum Proctor Normal (OPN). Special attention must be given to the compaction of

the nucleus to ensure that it will fulfill its functions afterward. The height of these dikes must not exceed 2 m.

- **The Basins:** The construction of the storage basins consist of the excavation and transportation of the material, compaction and protection of slopes and ramps. These structures have the function of increasing the volume and time of storage. In order to facilitate the access to the water, the basins are equipped with access ramps and to help orient the cattle in their movements, the ramps are equipped with wired fences;
- **Downstream water regulation channels:** Channels will be built to direct continuously the water to the downstream.
- **Protection of the slopes against silting:** this activity will be carried out as described under the item 2.1.1.1.

2.1.2.2. The construction of simple irrigation systems

The purpose of this ordering type is to: (i) adjust the water level in the perimeter; (ii) drain excess water during heavy rains; (iii) distributing water in plots, and (iv) irrigating plots during the rainfall deficit.

The development involving partial control consists of : (i) the construction of the collectors or drainage channels; (ii) the installation of aqueducts and/or PVC tubes; (iii) the construction of the structures of discharge or distribution; (iv) the construction of irrigation and/or drainage channels; (v) the construction the retention dikes or main dikes; (vi) the construction of dikes for protection against erosive action; (vii) the construction of downstream water regulation channels; (viii) the construction of the portion dikes; (ix) the construction of compartmental dikes; and (x) protection of the slopes against silting activities.

These infrastructures will aim, as appropriate, to: (i) reduce the level of flooding in the paddy field and drain surplus water during heavy rains; (ii) regulate the water level in the perimeter; (iii) distribute the water in the plots and encourage spreading, as well as maintaining a water slide in the basins; (iv) channeling water to the villages and lands downstream. The development should be designed so that it can irrigate rice throughout the vegetative period, evacuate critical floods during heavy rains, avoid flooding and maintain a water supply cultures. The role of each facility is described below:

- **The collectors or drainage channels:** They will have the functions of enabling the drainage of the ordered or improved perimeters and the spill-over of floods. They must be designed in order to serve the entire ordered perimeter. They have a trapezoidal section and the material obtained from the excavation will be placed in both margins to create dikes. These two dikes will be designed to be used as a way to access the portions, facilitate the mobility along the collector as well as resist floodings and overflow.
- **The aqueducts and/or PVC tubes:** They are placed in the collector below the retention dikes and must enable the evacuation of the floods. They are equipped with devices that control the water level upstream, shaped similarly to a floodgate. They have the functions of maintaining the water level high when the floodgates are closed. The dimensions of the aqueducts and/or number of tubes depend on the volume of water to be spilled-over. The tubes are installed perpendicularly to the retention dikes.
- **Structures of discharge or distribution:** These are relatively simple structures in terms of construction and usage, having the main function of contributing to the supply of the water demanded by the plants. Usually, these structures are used in valleys that present a considerable longitudinal inclination. These structures enable the elevation of the irrigation water levels in the collector and the deviation of the runoff water to

irrigation channels or even directly to the portions. They also have the function of keeping the water level high when the floodgates are closed.

- **Irrigation and/or drainage channels:** These are earthen channels that result from the extraction of soil for the construction of dikes in portions, according to the project, having the main function of conveying the flow taken by the discharge structure, next to the portions and/or facilitate the spill-over of the exceeding rainfall water;
- **Retention dikes or main dikes:** These are hydraulic structures that will have two main functions, which are (i) retaining water and flooding the portions of rice production upstream and (ii) retaining water and flooding to regulate water supply for the villages and lands in the downstream of the perimeters. The landfill for the retention dike will result from the excavation of the irrigation channel, placed in layers to create this dike. These dikes are built with an important component of clay in order to obtain a good constancy and resist the flow and infiltration. They will be compacted manually, in a way that enables them to resist the pressure exerted by the water flow. They must be installed perpendicularly to the runoff water flow direction, that is, perpendicularly to the collector. The exact position and shape of construction will be determined during the execution by the beneficiary, with the assistance of a technician/topographer. For retention dikes that will also serve as a roadway the landfill material will be lateritic clay and may, eventually, have a clay nucleus and its landfill must be compacted, with the help of machinery, at 90% Optimum Proctor Normal (OPN). Special attention must be given to the compaction of the nucleus to ensure that it will fulfill its functions afterward. The height of these dikes must not exceed 2 m.
- **Downstream water regulation channels:** Channels will be built to direct continuously the water to the downstream;
- **Dikes for protection against erosive action,** which have the functions of impeding the sand that results from the continuous erosive process in the lateral slopes from arriving to the valley, contributing to the conservation of the physical characteristics of the soils in the valley and contributing to the reduction of the silting up by weeds (see more description of dikes for protection against erosive action characteristics under the item 2.1.1.1.);
- **Portion dikes,** placed in the divisions of the portions, they have the function of facilitating the retention, distribution and management of irrigation water from the portions, slowing down the runoff of rainfall water, ensuring and regulating that water levels in the portions and enabling the independent management in the portions. These dikes are built with an important component of clay in order to obtain a good constancy and resist the flow and infiltration. The exact position and shape of construction will be determined during the execution by the beneficiary, with the assistance of a technician/topographer.
- **Compartmental dikes:** These dikes are placed perpendicularly to the direction of the water flow and are confectioned with an important component of clay in order to obtain a good constancy and resist the water flow and infiltration. Positioned perpendicular to the levee dikes, their function is to allow an early water supply of the portions, ensure the necessary level of water storage and the independent management of the water used for irrigation in the different portions of the same perimeter.
- **Protection of the slopes against silting:** this activity will be carried out as described under the item 2.1.1.1.

Output 2.1.3.: Rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs, machinery and tools

The activities to contribute to the improvement of the quality of the soil, the agricultural yield and the pasture will be conducted under this output. It is: (i) sensitization/Education about the harms of slash and burn agriculture practice on soil fertility and crop yields and dissemination and strengthening of climate-smart agriculture practices; (ii) Support to access improved, resistant and short cycle seeds ; (iii) Support to groups for the acquisition of quality fertilizers and pesticide ; (iv) support for the production of forage for livestock (Cultivation of brachiaria, moringa, fruit trees, etc.) and increase organic manure production; (v) support for the acquisition of equipment/facilities of production and development of products for demonstration.

2.1.3.1. Sensitization/Education about the harms of slash and burn agriculture practice on soil fertility and crop yields and dissemination and strengthening of climate-smart agriculture practices

Marginal land use profitability and ongoing land degradation cause severe problems for farmers, perpetuating the poverty cycle and exhausting natural resources. Current itinerant slash-and-burn agricultural practices in the project region are connected to soil erosion, loss of soil nutrients and drying up of springs, and have a negative effect on productivity of rice and other crops. The project will address risks related to slash-and-burn agriculture through four integrated strategies: (a) focus on irrigated agriculture interventions, which will directly reduce pressures on land clearance, and therefore necessity to practice slash-and-burn agriculture; (b) use of agroforestry interventions, where farmers know that they cannot practice slash-and-burn agriculture in such fields or orchards; (c) dissemination and strengthening of climate-smart agriculture practices. This particularly includes agroforestry and conservation agriculture methods, i.e. methods which minimize soil disturbances, utilize retention of crop residues and other surface cover, and promote crop rotation. While the focus of these measures is to contribute to stabilization of production and incomes, there are also important benefits to be realized with regards to reducing slash-and-burn agriculture and forest fires: (i) by creating buffers against drought impacts (through higher soil moisture retention); (ii) by recomposition of soil fertility; (iii) through lower fallow periods, thus directly reducing needs for slash-and-burn agriculture; and (iv) the possibility to work on any given cultivated field for much longer periods than would be possible under slash-and-burn agriculture (due to soil fertility maintenance and higher soil moisture retention).

The project will support the groups in the ploughing through mechanized during the first two years of the start of production means. This will make the soil easier to plow in the coming years through animal traction and the use of small tillers.

2.1.3.2. Support to access improved, resistant and short cycle seeds

Adequate access improved seeds increase agriculture yields. In the project area the producers do not have access to quality and certified seeds. This has implications for agriculture yields. The average agricultural yield is 600 kg / ha on average in current practices and traditional seeds.

The project will introduce in collaboration with the National Institute of the agrarian research (INPA), the improved seeds of rice with yields ranging from 5 to 6 t/ha on average and for

others improved seeds. To ensure the availability of improved seeds the project will sign a Memorandum of understanding with the INPA for the provision of the improved seed, at the start of the project. The INPA will support the project in the development of improved seed banks and in the training of the groups on these seeds multiplication techniques while ensuring the ownership of the activities by the producers. Producers will continue to produce the seeds improved in the following years on their plots with the close monitoring of the INPA. One to two seed banks will be built in each provincial area of intervention. In areas already containing seed banks, these will be strengthened to meet the needs of producers.

2.1.3.3. Support to groups for the acquisition of quality fertilizers, quality pesticide and crops conservation

Access and use of good quality fertilizers and pesticides increase agricultural production. In the project area the access of producers to quality and certified fertilizers and pesticides is limited. This has implications for production. Thus, in the first year of development, the project will support agricultural groups that do not have sufficient resources to acquire fertilizers and pesticides. Their acquisition during the next crops campaigns will be supported by producers who have already made profits in the first crop year. To ensure that the groups will continue to source quality pesticides and chemicals fertilizers, the PMU will bring producer groups into contact with fertilizer and pesticide supply structures. The project will support the farmer's crops conservation initiatives.

2.1.3.4. Support for the production of forage for livestock (Cultivation of brachiaria, moringa, fruit trees, etc,) and increase organic manure production

Gabu and Bafata regions are home respectively 47% and 19% of the livestock of Guinea Bissau (for a total of 66%). However, the drought and the lack of forage limit the development of this livestock during the dry season in these parts of the country. The result is the migration of farmers to the South of the country and the conflicts between breeders and farmers. So, the project will provide support to farmers in the production of brachiaria, a fodder plant adapted already experienced by the LDCF project in the Gabu region. The project will support the installation of brachiaria fields in each area of intervention at the rate of 10 hectares of pasture for pilot group of 50 heads of beef or 200 heads of small ruminants. Breeders will be trained on the production of the brachiaria techniques. These first brachiaria fields will produce seed for sowing from the rest of the pasture. Others forage and nutrients species will be tested namely moringa and other legumes to improve soil quality and health of livestock. Altogether, 1,000 hectares (100 units of 10 hectares) of pasture will be developed and 100 sheds will be built in each area to keep forage.

Grazing conducted in these fields will help to improve the soil that will be available for agriculture after three to four years. The rotation will be opted in the development of these fields of grazing. These actions will help to increase the production of manure to reduce chemical fertilizer requirements. In fact, the farmers and breeders groups whose capacities have been strengthened on the production of manure from livestock excrement (output 1.2.4), will produce organic fertilizer to substitute the chemical fertilizers and reduce the need for these in agricultural production. This will have a strong impact in the preservation of soils.

The project will support the breeders' groups for their specialization in the production of brachiaria seeds and its expansion in order to sustain the actions of the project in each area.

These activities will be conducted with the support of private structures or NGOs who support their evidence in this area.

2.1.3.5. Support for the acquisition of equipment/facilities of production and development of products for demonstration

The project will support groups for the acquisition of materials and equipment for production and development of products. This was a request from beneficiaries during public consultations for the preparation of the Full project. Thus, the project will be available to groups of producers of tillers, the weeders, threshers and the hullers. Demonstrative title, 20 tillers, 1000 weeders and 20 hullers will be acquired. In addition, 60 farmers or groups of farmers practicing agriculture (farmers) will be supported for the promotion of culture with oxen and ploughs. The horse in harness culture will help to transport crops with carts.

Famers groups and breeders groupes financed in this framework will have to repay the costs of facilities in-kind (products) or species. Repaid funds will be reinvested in the project for the purchase of other equipment in case the tests will be conclusive or the development of other activities for the extension of the areas. A contract will bind the project and groups for this purpose.

The material and equipment acquired by the beneficiaries, will be leased to other beneficiaries, if possible.

The PMU will ensure that the beneficiary groups of these materials and equipment chosen on a competitive basis. Only well motivated and well organized groups will be beneficiary.

2.1.3.6. Support for the adaptation of the cultural calendar to climate disturbances

The project will work with weather services for reliable information to better plan agricultural production in relation to climatic changes. Support on site will be provided to farmers by the technical departments of meteorology. A Memorandum of understanding will therefore bind the project to the National Directorate of meteorology of Guinea Bissau. In order to have data rainfall specific areas of intervention and better plan agricultural campaigns, 120 rain gauges will be acquired and installed in the project area.

2.1.3.7. Support for the analysis of the quality of soil and water

Monitor soil and water quality will allow better planning of adaptation actions and preventing declining yields and certain diseases. Thus, the quality of soils and waters will be followed by technical services of the State namely by the Competent Environmental Assessment Authority (AAAC) and the national laboratories. Thus, the project will bring support for the AAAC in the acquisition of equipment for analysis and follow-up of the soil as well as water quality.

Output 2.1.4. Construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development

The problem of drinking water supply arises in the villages identified in the intervention regions of the project. The pricing of creeks as abridges also causes enormous problems for livestock farmers to catch livestock water. This forced them to head south in search of water and forage. Enormous losses are recorded and conflicts arise between breeders and farmers of off-season. Also, the project proposes to carry out actions to co-benefit water supply for populations, livestock and for development of gardens. The actions envisaged are: (i) construction of drills/wells; and (ii) construction of ramps to access Corubal River.

2.1.4.1. Construction of drills for improved livestock and domestic water supply and market gardens development

The project will carry out human-powered drilling to improve the availability of drinking water in villages and develop market gardens.

As far as market gardens are concerned, 20 wells will be built to promote the development of 100 hectares, at least, of market gardeners. Crops with nutritional value will be developed according to local soil and / or climatic characteristics. This include, among other things the following speculation: tomato, onion, potato, pepper, cabbage, carrot, eggplant, okra, sweet potatoes, spinach, pepper, the cucumber.

Regarding domestic water supply, 10 drills will be built with drinking troughs for livestock.

The Geotechnical studies will be conducted after drills realization.

2.1.4.2 . Construction of ramps for improved livestock and domestic water supply

This development consists in the construction of ramps to facilitate Corubal River access for livestock and population. Construction consists of excavation, transportation of the excavation, in the protection of the embankment, compaction and the protection of the ramp. And to guide the flocks, the ramps will be protected by barriers of steel wire. The project is planned to build 5 access ramps to the Corrubal River for livestock and domestic water supply. Specifications, construction details and plans type of ramps will be defined by detailed technical studies.

Component 3: Knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning

The objective is to develop and operationalize a system of communication and knowledge sharing for the adoption of good agricultural practices climatque resilient to change to support food sécurité in Guinea Bissau and West Africa.

Outcomes of component #3 will thus be (1) adoption of sustainable climate-smart agricultural practices and risk management in comparable regions of Guinea-Bissau, contributing to resilience and development needs in those regions.

Outcome 3.1: Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries

Output 3.1.1: Development of knowledge management strategy

In order to guarantee visibility of the project results a knowledge management strategy will be developed. Lessons learned will be of interest to Donors, Government, civil society and vulnerable populations. Knowledge sharing and learning will count on a project knowledge management strategy, with communication products tailored for different target groups (including hard copies, electronic form), alternative communication means such as community theatre, radio and story-telling, project website, technical reports and documents on lessons learned to UNDP's Adaptation Learning Mechanism (ALM) and other relevant platforms, hands-on study visits and annual RCCF meetings to join and share experiences with Gabú and Bafatá farmers. The project will target existing institutions and fora (e.g. RCCF, inter-ministerial committees) and contribute to the strengthening of subproject replication under GEF/UNDP-00077229, thus contributing to increased capacity in adaptation practices and policy in the focal area of climate-smart agriculture and resilience.

The project will also establish a program of outreach and dissemination of radio programs on topics related to climate change, gender and HIV/AIDS, to the rational management of natural resources. Awareness campaigns will be conducted twice per year in each beneficiary village.

The radio broadcasts will expand the impact of the project scope. The project will include in the knowledge dissemination strategy, community structures at the local level.

If necessary, training will be given to the Member of the PMU especially the head of communications for better internal and external communication of the results and lessons learned from the project.

Output 3.1.2: Developpement and animation of project website

To facilitate access to project information by the public, a website dedicated to the project will be created. The results (outputs, outcomes and impacts) and lessons learned from implementation and the various reports will be shared/disseminated on the project website. This site will be animated by a set of actors.

In addition to this website, a platform of exchanges will be created to allow the various actors to participate in the discussions relating to climate change and fast actions that can mass.

Output 3.1.3: Development of manual and other materials on best practices and measures for climate-smart agriculture

The core dissemination product from the project will be a manual of practical and concrete best-practice in climate resilient agriculture. Various versions of the Manual will be produced, both technical and non-technical, in Portuguese, French, English and local languages (*creole, mandinga, peulhs*), as well as smaller summary briefing sheets/tools box/calendars on relevant thematic topics. The manual will be disseminated through the project website and a suite of workshops at the national and provincial level. In addition dissemination will take place across the West Africa region through workshops and dissemination of hard copies. The project team will further interact with national media outlets (newspaper, internet, radio, etc.) to make the public aware of climate risks and adaptation needs. Scientific publications with regards to impact assessment of components #2 is also planned. Finally, the project results will also be shared through international fora on climate change (including, in particular, UNFCCC).

Output 3.1.4: Dissemination of results to other regions of Guinea-Bissau and West Africa

The lessons learned are used to strengthen climate-smart agriculture in Guinea-Bissau. Interesting results and new lessons are expected from result the implementation of the project regarding (i) climate-smart agriculture, and its linkages to climate adaptation, water resources management, sustainable use of natural resources, and buffer against drought impacts; (ii) managing climate risk through contingency plans (contingency plans for crop and livestock management, seasonal forecasts for adapting planting calendars, protection against impacts from extreme weather events, such as flash floods or forest fires – i.e. contingency plans that both protect interventions carried out under Component 2 as well as contingency plans to protect human life directly against adverse impacts from extreme weather events); and (iii) mainstreaming of adaptation into development planning, taking into consideration that this project is the continuity of a pilot project at national level (GEF/UNDP-00077229). Reflections will also include (iv) identified project weaknesses in order to propose new solutions for new beneficiaries of other projects.

Note that the knowledge dissemination to other West African countries will be based on internet communication and website information.

Given that communication channels with other West African countries have already been established through GEF/UNDP-00077229 project this new focus will only have limited impact on the project's outreach activities.

- B.** *Describe how the project / program provides economic, social and environmental benefits, particularly in the most vulnerable communities and vulnerable groups within communities, including gender considerations. Describe how the project / program will avoid or mitigate negative impacts, in the respect of the environment and social policy of the Adaptation Fund.*

East Guinea-Bissau is a dryland region which is extremely vulnerable to climatic change and variability. Family farmers' coping mechanisms in Gabú and Bafatá 'regions' (temporary nomadism, reduction of food intake, cashew as only cash crop, selling of household assets, migration to cities, etc.) are insufficient even under current climatic variability (dry and wet seasons) and extreme events (droughts, inundations, etc.), and given their scarce assets (economic, financial, education, etc.), an autonomous uptake of sustainable water and agriculture technologies and practices (i.e. climate-smart agriculture) which would permit them to improve their livelihoods is highly unlikely in absence of the project's interventions.

In this context, the project's components will provide economic, environmental and social benefits to the communities in Gabú and Bafatá, particularly to farmers more at risk.

Environmental benefits

With respect to environmental sustainability, the project will reduce pressure on forest resources, deforestation and soil erosion through promotion of agro-ecological practices and 'environmental vigilance committees' (both implemented successfully under GEF/UNDP project 00077229) which monitor illegal deforestation, overuse of forest resources (e.g. hunting) or pollution of the environment, among other. These actions are particularly important in the context of forest resources sustainable management in the eastern hinterlands of Guinea-Bissau.

- Sustainable management of resources forestry

Activities to protect the perimeters through reforestation, bush fire control activities through the establishment and training of fire brigades, the fight against slash-and-burn agriculture, sensitization of people on the protection of forests are all activities that will enable the protection and sustainable management of forest resources.

- Sustainable management of water resources

The implementation of the water mobilization infrastructure and the technical and organizational support that will be provided by the project in the management of the perimeters will be beneficial for the sustainable management of water resources in the project areas.

- Improvement or maintenance of the quality of the soils

The implementation of soil conservation activities, the promotion of organic fertilization, awareness-raising for the reduction of slash-and-burn agriculture, the practice of livestock stabling, the promotion of the best cultivation techniques for soil conservation erosion-control and silting of perimeters activities, reforestation, etc. will improve the quality of the soil.

- *Protection of water and soil resources through the improvement of producers' capacity in the management of pesticides and chemical fertilizers*

Excess dosage, poor storage, poor knowledge of the persistence of pesticides or its accidental release into the environment may lead to infiltration of the active substance into soils, surface and subterranean waters. The various trainings and advisory support that will be provided to producers under the project will certainly strengthen the capacities and practices of producers on the plot of efficient and effective management of fertilizers and pesticides. This will preserve the environment including water and soils resources.

Socio-economic benefit

Economically, the interventions aim to improve and stabilize income from agricultural activities through diversification of income streams to farmers, with secondary economic benefits in the near- to mid-term through the strengthening of both 'regions' economies. Socially, the main benefits will be to stop the displacement of people, both by reducing susceptibility to extreme events, as well as through decreased need to move cattle herds temporarily due to low feed availability (caused by climatic events and/or overgrazing); reduced loss of livelihood security caused by extreme events or overall annual climatic variability would be an additional social benefit of the project. Specifically, the positive socio-economic impacts associated with the implementation of the project include (i) increased capacity of stakeholders for the development and implementation of resilient approaches to the adverse effects of climate change; (ii) job creation; (iii) contribution to food security; (iv) Improvement of women's incomes and development; (v) Improving the nutritional health of populations; (vi) Improvement of farmers' production and incomes; (vii) reducing the phenomenon of exodus and strengthening the family ties; (viii) improvement of community life; and (ix) contribution to the social organization of the community.

- *Enhance the capacity of stakeholders for the development and implementation of resilient approaches to the adverse effects of climate change*

The project is a smart agriculture project that aims to reduce the vulnerability of agricultural systems against the adverse effects of climate change in the areas of intervention. The capacity-building activities of the stakeholders (producers, civil society and government agents), programmed within the framework of the project, will improve the capacities of all these actors in initiating and implementing approaches resilient to climate change.

All activities in the project component #2 will be developed jointly with the rural villagers and their representative institutions in order to create a shared understanding on climate adaptation; including the assessment of concerns and needs of the most vulnerable communities as identified under component #1. The team will initiate activities using diagnostic and rural planning techniques common in rural extension activities (PRA and RRA).

These capacity-building actions will also benefit women and young people by offering them a privileged opportunity to participate in a lucrative activity on a par with men and to improve their level of organization and involvement in decision-making.

- *Creation of jobs*

The activities related to the complementary studies, the construction of hydraulic structures (~ 15 % of the construction cost which is over 800 000 USD), the capacity building by the consultants, the salaries of the PMU which allow 654 000 USD, soil preparation, tillage and many other activities are likely to promote direct employment, mainly made up of local

labor. Indirect jobs will be created along the procurement of fertilizers and commercialisation of agricultural products.

- *Contribution to food security*

The project will contribute to reducing risks related to food insecurity. Through the development of irrigated perimeters by water mobilization infrastructures for optimal irrigation, technical advisory support to producers, support for improved seed acquisition, dissemination of adapted cropping techniques, the project improves production both quantitatively and qualitatively. In the case of rice cultivation, agricultural yields will increase from 0.6 tonnes “without project” to 4 tonnes “with project”. Other yields will increase from 10 tonnes to 25 tonnes for potatoes, from 8 tonnes to 23 tonnes for onions and from 8 tonnes to 24 tonnes for tomatoes. This will greatly reduce the food insecurity of beneficiaries.

Implementation of the project will increase the availability of rice as the main food of the population, potato, tomato and onion per the values mentioned in the tables below:

		Without project	With project	Added value with adaptation actions
Rice (1362 ha)	Yield (tonne / ha)	0.6	4	3.4
	Production of 1362 ha (tonne)	817.2	5448	4630.8
Potato (200 ha)	Yield (tonne / ha)	10	25	15
	Production of 200 ha (tonne)	2000	5000	3000
Tomato (100 ha)	Yield (tonne / ha)	8	23	15
	Production of 100 ha (tonne)	800	2300	1500
Onion (100 ha)	Yield (tonne / ha)	8	25	17
	Production of 100 ha (tonne)	800	2500	1700

The project will therefore generate a substantial gain in agricultural production, and thus contribute to enhancing food security.

- *Women, children and the elderly improvement*

Women, children and the elderly are frequently amongst the more vulnerable of the poor. Women in rural Guinea-Bissau are responsible for 55% of agricultural production, with their role especially important in the dry season when they focus on garden produce. There is further evidence that programs focused on women improve food security of their family more directly than those focused on men (Asian Development Bank and FAO, 2013). However, despite their important role in agriculture and for food security, gender issues are little considered in Guinea-Bissau’s policy considerations. In the villages, their participation may be limited/suppressed where elders or religious leaders opine directly against women participation due to conflicts with traditional religious laws. The project team is aware of these problems, and will openly encourage women empowerment at all stages of the project; this includes (i) discussing the need to integrate women into projects with village elders and other leaders; (ii) opening subproject grants for women's associations for small equipments acquisition, i.e; (iii) strengthening their role in the relevant institutions on climate change in the region (particularly the Rural Forum on Climate Change – see section III); and (iv) promote their participation in broader land and water management issues which are traditionally led by male members of

the tabancas. A mobilization of women was noted during the public consultations for the preparation of this full project. It's to be noted that, the women are more involved in the cultivation of rice, the main food consumed by the 90% of the population in the project area.

- *Improvement of the nutritional health of population*

Diversification of production and improved yields will contribute to improved nutrition among beneficiaries. As a reminder, the means developed by farmers to cope with the lack of food are among others, the reduction of several meals, consumption of less preferred foods, reduction of food dishes of adults for the benefit of children. With the project, the latter will feed properly and they will be able to diversify their food.

- *Increase in producers' incomes*

The increase in market gardening production should make it possible to improve the incomes of producers. The following table summarizes the expected revenues for the implementation of the project.

	Rice	Potato	Tomato	Onion	Total
Operating income with project (USD)	2 159 860	1 942 800	752 520	699 240	5 554 420
Operating income without the Adaptation Fund project (USD)	26 754	1 160 680	292 340	292 340	1 772 114
Value added to the project through implementation of adaptation Measures (USD)	2 133 106	782 120	460 180	406 900	3 782 306

This smart agriculture climate project will be cost-effective. The agriculture component can benefit from \$ USD 5 554 420 per year, considering the assistance of the Adapt Funds (AF). Without the project, this benefit is \$ 1 772 114 per year. Thus, the contribution of a climate-smart action for agriculture is 3 782 306 USD per year.

- *Reduction of the phenomenon of exodus and reinforcement of the family ties*

Migration and rural exodus represent a characteristic of population dynamics in North-eastern Guinea Bissau. This mobility during the dry season contributes to meet the basic needs of rural households. Thus, the development of irrigation as envisaged by the project will make it possible to curb mobility (migration and rural exodus), to restore the economic system in the beneficiary zones and to bring about a substantial qualitative improvement in living standards, and therefore place agricultural activity as a means of combating poverty, controlling migratory flows and preserving the family ties.

- *Improvement of community life*

The current context, characterized by the gradual disengagement of states, the implementation of the decentralization process, the empowerment of civil society and the strengthening of the role of the private sector, offers the rural world new perspectives and opportunities to participate in the definition of policies, strategies and projects and their implementation. For this reason, the activities of farmers' organizations are very diverse. They concern the development of agro-pastoral production, market gardening, fruit-growing, marketing and handicrafts, exploitation and processing of forest products, actions to manage natural resources and protect the environment. Thus, the interventions of the project will create a full involvement of farmers' organizations and thus allow the development of community life which

is one of the key elements of the sustainability of all the actions planned within the framework of the project.

- *Contribution to the social organization of the community*

The impacts of the project on socio-cultural organization include:

- strengthening local farmers' groups or organizations;
- the social and institutional support that developed sites will induce;
- the establishment of management committee;
- strengthening capacity of farmers.

NGOs to be selected as partners for local implementation will have solid experience in these techniques, having used them with local communities in the area as they developed 'local tabanca development plans' during the last few years. Principles to be considered for local interventions will include, among other:

- Encouragement of participants to take responsibility;
- Respecting the diversity of the tabancas;
- Promote full participation;
- Reconciling different interests; and
- Involving multidisciplinary approaches and teams (on the project's technical side).

At national level, the Project Management Unit (PMU) should also pursue the inclusion of qualified women technical personnel into the project team. As such, the project is to make an important contribution to women empowerment in Guinea-Bissau, not limited to the project region.

In order to mitigate and/or avoid negative impacts and to improve positive impacts, specific indicators on key economic, social and environmental variables will be integrated in the results-framework, therefore assuring compliance with the Adaptation Fund's Environmental and Social Policy (ESP). These indicators are to be monitored and evaluated regularly throughout the project, and will be reported to the PMU in order to prevent violation. Field teams and PMU will regularly interact with the relevant persons and institutions in the project region and tabancas to resolve any possible conflicts.

C. Explain how the proposed project is a cost-effective or provide a cost benefit analysis.

Vulnerability to climate change is multi-faceted; this is why additionality to a socioeconomic baseline scenario is hard to prove. Furthermore, there are limited options for Bafatá and Gabú farmers in terms of alternative actions to build climate resilience in their agriculture and water resources management. The project thus proposes a combination of strengthening rural livelihoods with integrated climate risk managed that take into account local development needs of the communities. Such incremental and/or systemic adaptations are being proposed and carried out by various international institutions, and follow the UNFCCC's recommendations on adaptation projects for LDCs (UNFCCC, 2010). While most of these adaptation projects currently address climate variability and not precisely future climate change, they follow clearly the adaptation concepts and planning related to recent UNFCCC and World Bank conceptions – particularly no-regret and low-regret strategies, and avoiding mal-adaptation (Adger et al., 2007; Barnett and O'Niell, 2010; Heltberg et al., 2009; UNFCCC, 2010).

All project interventions target the most vulnerable communities in the project region, some of whom have already been displaced, who produce considerable amounts of the countries' staple food crops and where the most vulnerable sector as identified in the NAPA is important in economic and social terms. Total investment of pilot activities will likely be around US\$200–250/inhabitant (based on GEF/UNFP project 00077229 preliminary estimates). As a matter of comparison, an adaptation project at community level run by the NGO Practical Action spent about \$150 per inhabitant in Pakistan, although population was more densely spaced in sites targeted and the project had a shorter duration. In a country like Guinea-Bissau, with rather high transaction costs and low pre-existing investments in rural areas, \$200–250/inhabitant in the Gabú and Bafatá region over a five-year period is quite reasonable, and the proposed adaptation measures (component #2) are deemed cost-effective. Furthermore, in order to assure effectiveness and efficiency, both costs and benefits of the particular technological interventions will be assessed at household and community-level before implementation (see Chambwera et al., 2014).

The proposed approach integrates urgent rural development needs (food security, income generation, sustainable use of natural resources, etc.) with climate risk management. While investments in small-scale infrastructure (e.g. irrigation or small dams) and technical assistance are necessary, but not sufficient for allowing rural populations to adapt sustainably to climate change, project outcomes (resilience) of this proposed project are nevertheless conditional on those investments. This is highlighted in Guinea-Bissau's Second National Communication to the UNFCCC (SEAT/DGA and Republic of Guinea-Bissau, 2011) and NAPA (Republic of Guinea-Bissau, 2006).

Planned actions and activities for this project proposal have been selected because of their cost-effectiveness. This is highlighted in the mid-term evaluation of the LDCF project (Quesne and Jandi, 2013) on which this present proposal is based. Four points support this argument: (1) it is found that the LDCF project appropriately addresses the priorities, institutional and structural needs identified in governmental institutions vis-à-vis the objectives and vision of national and regional policies, and vis-à-vis the needs and expectations of grassroots communities; (2) the thematic intervention are relevant for the project region of Gabú (14 villages) which identified as extremely vulnerable in terms of climatic and social aspects with low to very appropriate technology adoption (15% to >50%); (3) the logical intervention framework of the LDCF project – in the context of multiple stressors, climatic and non-climatic – is evaluated as clear and well-articulated with clear institutional responsibilities and a clear theory of change supporting this framework; and (4) financial and human resources are evaluated as being appropriately utilized for each LDCF project component. Therefore, evaluation concludes that “In view of the different activities funded and benefits and the level of achievement of expected effects [...], it is not clear that additional results could have been achieved with the same level of financial resource” (Quesne and Jandi, 2013, p. 32). This means that each work package in itself has proven to be cost-effective in terms of envisaged outputs.

In this background, the mid-term report of the LDCF project specifically recommended further extension related to dissemination and appropriation of modern farming techniques, improved water management, adoption of breeding techniques in villages in the project region. With regards to cost-effectiveness two important points are related to the distances between the villages which are quite large: (i) the operational difficulties for the project team, because the distances are quite long and it may therefore be difficult for the project team to cover the 14 sites with the means currently available to it; (ii) challenges for the dissemination and replication techniques and results of the project. The 14 villages being fairly remote, it is difficult for the project to get a critical mass of producers and farmers who have adopted the technology promoted and can thus disseminate within the region and the country. It would be wise that the approach of the new project to focus its interventions in neighboring villages which have not been affected by the LDCF project to achieve a critical mass of beneficiaries able to

disseminate the acquired (Quesne and Jandi, 2013). The project proposed to the Adaptation Fund aims to address this concern by increasing the number of beneficiaries and tabancas, therefore decreasing cost per unit. In addition this proposal proposes to add small scale water retention, fire prevention and other relevant activities related to climate-smart agriculture in order to increase resilience and improve living conditions of farmers in Gabú and Bafatá. In order to keep transaction costs related to project implementation and technical assistance within safe limits, the project sites in Gabú and Bafatá 'regions' will be within maximum 6 hours travel of one another, and within 4 hours of Gabú administrative center. This means that efforts can be focused, and technical assistance can be located within a reachable distance (as opposed to being located in Bissau). For this the project team will apply, among other, remote sensing/GPS tools to minimize operational costs and therefore achieve higher cost-efficiency in the proposed Adaptation Fund project.

Other possibilities to achieve higher cost efficiency that arose from the LDCF project focused on further minimizing risks of "bad financial governance and corrupt practices" which could lead to a reduction in planned funding for each of the activities in the LDCF project. The positive mid-term evaluation for the LDCF project (Quesne and Jandi, 2013) noted that UNDP has provided all procurement and disbursement processes from November 2011 to June 2013. Based on this information, the risk of "bad financial governance and corrupt practices can lead to a reduction in planned funding for each of the expected effects" was evaluated as "virtually nil". Ongoing procedures to minimize fiduciary risk in the context of the current political and institutional situation in Guinea-Bissau will thus be continued in a potential Adaptation Fund project. Annual procurement plans will be utilized to speed up administrative and financial procedures. In addition, the policies and procedures of the West African Development Bank on compliance and to fight frauds and corruptions will be implemented for this project. A clear manual of procedures will be prepared to manage these risks.

The needs and priorities identified during group discussions with the beneficiaries found that many tabancas and/or families still lack basic agricultural equipment (no huller for rice, mills for maize or for millet), are inadequately covered in terms of their water resources needs, without basic health in some villages, very low access to contextualized education, etc. An Adaptation Fund project could effectively reduce these and other problems in Gabú and Bafatá Regions while simultaneously reducing vulnerability to climatic variability and change.

The LDCF project alone could not cover the needs of participating communities. Other projects and programs (see following section D) deal with emergency food provision, biodiversity conservation, or agricultural development, however, not in an integrated and transversal approach such as through the LDCF project. Currently there are no other projects and programs in Guinea-Bissau that cover risk reduction at the level of the LDCF project – scaling up existing activities can thus provide extremely valuable lessons for climate adaptation planning and climate-smart agriculture in the country.

Alternatives to this project proposal were discussed with potential beneficiaries in both Regions: (1) a support project for the production and local distribution of agricultural equipment; and (2) a support project for seed production that are more resistant to climate variability and change (to be developed in partnership with the Institute of Research on the Adaptation of Rice). While relevant in terms of their activities, discussions led to the finding that such activities could be better developed in separate accompanying projects for which funding will be sought. Participants from the LDCF project, as well as the mid-term evaluation of the same project, found that an extension in scale and (more limited) scope of the LDCF project would provide most immediate benefits in a cost-effective manner to a significant population in extremely vulnerable Bafatá and Gabú Regions.

To ensure that the investment costs are used cost-efficiently, regional and/or international tenders will be launched. National Partners who performed satisfactorily under the

GEF/UNDP-00077229 project will be allowed to participate in those competitions. The Project Management Unit (PMU) could be authorized to practice a national preference in case domestic companies demonstrate in their proposals the same technical skills and competitive prices equal to those of regional and international companies. Each company interested in submitting a tender will be required to use local workforce and interventions by community-based-organizations (CBOs). With regard to purchases of materials, the PMU will consolidate on markets and launch international calls. The prices to be applied will be those of materials delivered to site, i.e. including transportation costs. Purchases will be made at national level if prices prove competitive. The project also proposes to broaden the choice of providers from CBOs for small activities to ensure competitive costs, durability of interventions, and more effective dissemination of activities and results.

It should be noted that this project follows the country's NAPA's adaptation priority list, which already considers cost-effectiveness as a key concern for the prioritization of measures. The measures are furthermore linked to recent UNFCCC and World Bank concepts such as no-regrets and low-regrets strategies for adaptation. The project is an adequate response to the priorities needs of Guinea Bissau presented by the National Determined Contribution (NDC). The specific project interventions will follow a ranking of costs and benefits, including inputs needed (e.g. labor, materials, finances, time) and positive outcomes (e.g. increased income, increased livelihood security, better flood/drought protection). Underlying needs or demand for the activity, level of familiarity with, and acceptability of activities (including attention to differing responses by gender) and environmental benefits will also be considered.

Alternative analysis

Three alternatives are considered: (i) Alternative 1: Without project; (ii) Alternative 2: Development of a classic project without climate change resilient actions; And (iii) Alternative 3: Development of the current project "Scaling up climate-smart agriculture in Guinea Bissau".

Alternative 1: Without project

The alternative without project means not doing the Adaptation Fund project. In this case, farmers will remain vulnerable to climatic changes as long as possible. Agricultural yields will continue to decline. The production will remain low and food insecurity and poverty will gain more ground in connection with population growth.

Indeed, the current situation is marked by early floods and droughts, which limits the efforts of farmers. Agricultural techniques have remained rudimentary; producers cannot deal with these phenomena of climate change.

Without the project, sites will remain exposed to floods, the silting up due to the erosion of the land upstream. The forests will remain prey to bush fires during the dry season, and their ecological and environmental importance will decline. The lack of water to irrigate crops during dry periods will remain and the rate of food insecurity may increase.

Regarding livestock, the alternative without project means that livestock remain exposed to the lack of drinking water and fodder in connection with recurring droughts. Transhumance in search of fodder and water will increase. Loss of livestock and conflicts between farmers and herders during transhumance could increase. Lack of water for livestock watering will continue and water-related diseases may increase.

The alternative without project is environmentally, economically and socially unsustainable. It does not allow the achievement of a sustainable economy because the country will be obliged to put in place in the medium term emergency programs to rescue the populations in these regions. These programs from a financial point of view will cost the country and the donors more than the project under development to have the same results.

Alternative 2: Development of a classic project without resilient actions on climate change

This alternative is to implement a project that does not include resilient actions on climate change. Such a classic project may concern: (i) the development of the sites without infrastructure of mobilization of water, (ii) a simple development of the sites without flood protection actions and the silting up of the sites; (iii) development of the trays with Wells; (iii) the development of the sites without actions of capacity building of producers on adaptation techniques;

This alternative is less costly but will not produce convincing results. In view of the topography and the effects of climatic disruptions, which are manifested in irregular rains, the lowlands where the crops develop are flooded during the rainy season and dry up during the dry season. This phenomenon is coupled with the erosion and transport of sediments that sand the shallows. This limits the development of these lowlands. This alternative therefore does not solve the problems faced by the populations.

Alternative 3: Development of the current project

With the project of the adaptation fund, a series of activities will be implemented in order to deal with the main issues related to the vulnerability of populations to climate change and strengthen the capacities of actors to undertake beyond the adaptation of small and medium scale actions. These activities concern :

- socio-climatic vulnerability assessment for East Guinea-Bissau;
- assessment of technical capacity building needs of ministries and field operatives for adaptation planning;
- formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources;
- technical trainings on adaptative systems and organizational capacity building for identified target groups;
- technical assistance and rural extension for subprojects;
- formulation/Update of contingency plans for climate-risk management;
- support for famers groups by the government technical experts for adaptation actions implementation;
- capacity building to prevent forest fires;
- Development of lowlands to maintain agricultural production in droughtperiods
- Construction of micro-dams for irrigation of rice, vegetablecrops and livestock water supply
- rehabilitation/improvement of soil productivity and small-scale investments into agriculture inputs (seeds, fertilizers, pesticides quality), machinery and tools;
- construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development;
- development of knowledge management strategy;
- creation and operating of the project website;
- development of manual and other materials on best practices and measures for climate-smart agriculture; and
- dissemination of lessons learned to other regions of Guinea-Bissau and West Africa.

These activities will contribute to achieving environmentally, economically and socially sustainable development. At the environmental level, activities to protect the perimeters through reforestation, the establishment of infrastructures for water mobilization and soil conservation will help to preserve the environment, notably forest resources, water resources and maintenance of the quality of the soils. In economic terms, the project activities allow the

creation of jobs, the improvement of farmers' production and incomes, the improvement of women's incomes and their development as well as the improvement of the level of life of target areas. At the social level, the project promotes the reduction of the phenomenon of rural exodus and the strengthening of the family fabric, improving food and nutritional health of populations, poverty reduction and the strengthening of community life.

The following table shows the analysis of the various alternatives:

Table: Alternatives Analysis

	Alternative 1: Without project	Alternative 2: Development of a classic project without climate change resilient actions	Alternative 3: Development of the current project "Scaling up climate-smart agriculture in Guinea Bissau".
At the environmental level including the resilience of populations and livestock to the adverse effects of climate change	<ul style="list-style-type: none"> - Flooding of sites - Silting of erosion of upstream land. - Bush fires during the dry season - Land degradation - Reduction of agricultural productivity. - Destruction of soil quality - Increase vulnerability to the adverse effects of climate change 	<ul style="list-style-type: none"> - Soil erosion - Flooding of crops during rainy season - -Silting up of the underworld due to sediment transport - Water deficits during the rainy and dry seasons - Drying of the gutter during the dry season - Degradation and destruction of soils - Low agricultural productivity - - Release of atmospheric co2 from bush fires 	<ul style="list-style-type: none"> - Building resilience of people and livestock against the harmful effects of climate change - Protection of the underground flood, silting and drought - Sustainable use of the highlands - Improving and maintaining the quality of soils - Sustainable management of water resources - Sustainable management of forest resources - Protection of water resources and soils through improvement of the capacity of producers in the management of pesticides and chemical fertilizers
At the economic level	<ul style="list-style-type: none"> - Increase in expenses related to the acquisition of food - Diminishment of labor workforce - Pauperization of populations especially women and young people - Strong dependence on the external market for food - Unsteadiness of Trade Balance 	<ul style="list-style-type: none"> - Low improvement in the incomes of farmers, including women and young people - Increase in expenses related to the acquisition of food - Diminishment of labor power - Pauperization of populations especially women and young people - Strong dependence on the external market for food 	<ul style="list-style-type: none"> - Improvement of women's incomes and their development - Improved income for producers - Development of the internal market in food - Support for the acquisition of improved seeds - Extension of adapted cropping techniques

		<ul style="list-style-type: none"> - unsteadiness of Trade Balance - Exit of foreign currency 	<ul style="list-style-type: none"> - Improvement of agricultural yields
At the social level	<ul style="list-style-type: none"> - Lack of jobs - Food Insecurity - Nutritional Diseases - Rural exodus - Transhumance - Deterioration of the family ties - Lack of drinking water - Lack of organization of peasants - Conflict between farmers and ranchers in the use of water and space. 	<ul style="list-style-type: none"> - Low job creation - Poor improvement of farmers' living conditions - Low Poverty Reduction - Food insecurity - Persistence of nutritional diseases - Persistence of transhumance - Persistence of rural exodus - Lack of drinking water - Persistence of conflicts between farmers and ranchers in the use of water and space 	<ul style="list-style-type: none"> - Strengthening of the farmers' organization - Better involvement of farmers in decision-making - Job creation - Improvement of the living conditions of peasants, including women and young people - Poverty reduction - Food Safety - Diminishment of nutritional diseases - Reduction of transhumance - Reduction of rural exodus - Availability of drinking water for the population and livestock - Reduction of conflicts between farmers and ranchers in the use of water and space
At the financial level	<ul style="list-style-type: none"> - Exit of foreign currency to finance the purchase of food - Funding for emergency food programs. - Increase in farmers and state debt 	<ul style="list-style-type: none"> - Persistence exit of foreign currencies to finance purchase of food - Funding for emergency food programs. - Increase in farmers and state debt 	<ul style="list-style-type: none"> - Reduction of foreign exchange exit to finance the purchase of food - Reduction of farmers and state debt - Availability of financial resources at the farmers' level to refinance agriculture and livestock.

In concrete terms, the Adaptation Fund project, if implemented as planned, enhances the resilience of beneficiaries to climate change risks. The project's activities make a substantial contribution to the production of cereals, particularly rice, which is the fundamental food for households and vegetable food. It will improve access to drinking water for people and livestock and will help to sedentarize herds of livestock and the development of pastures and hay. The production of organic smoke can increase with the sedentarization of animals. This added to the fight against bush fires and the intensification of irrigated agriculture will make sustainable the production of food and improve the nutrition of the populations.

This smart agriculture climate project will be cost-effective. The agriculture component alone allows beneficiaries to achieve a profit of \$USD 5,554,420 per year, taking into account the assistance of the Adaption Funds (AF). Without the project, this benefit is \$ 1,772,114 per year. Thus, the contribution of a climate-smart action for agriculture is 3 782 306 USD per year. This represents about 37% of the Adaptation Fund's investment of USD 9 979 000 (see table below). This table is the summary of the different operating account of the project (see detail in annex 13).

Table 9: Operating result according different crops

	Rice	Potato	Tomato	Onion	Total (USD)
Operating results with Project (USD)	2 159 860	1 942 800	752 520	699 240	5 554 420
Operating results without the assistance of the Adaptation Funds (USD)	26 754	1 160 680	292 340	292 340	1 772 114
Gain from project with assistance of the Adaptation Fund (USD)	2 133 106	782 120	460 180	406 900	3 782 306

The Crops production gains with Adaptation actions implemented in the framework of the project is 9091140 kg per year (see table below).

Table 10: Crops production

	Rice	Potato	Tomato	Onion	Total
Crops production with the project (Kg)	4 358 400	4 500 000	2 160 000	1 966 500	12 984 900
Crops production without the Adaptation Fund project (kg)	653 760	1 800 000	720 000	720 000	3 893 760
Crops production gains with Adaptation actions implemented in the framework of the project (Kg)	3 704 640	2 700 000	1 440 000	1 246 500	9 091 140

If we consider that the deficit in rice per inhabitant is 54,6 kg (i.e. 38,22 USD per year, as per surveys on food security and vulnerability of rural households) and that the purchasing price of imported rice is 350 FCFA (0,7USD) per kg, then the project contributes to food security through the application of adaptation measures by providing and securing the rice need for 98 961 inhabitants.

To ensure sustainable food security in the country, it is highly recommended to replicate the project in other regions and sectors of the country.

D. Show how the project / program meets the national and local sustainable development strategies, including, if appropriate, national and local development plans, strategies for poverty reduction, national communications, action programs for adaptation to climate change or other instrument, if any

The National Communication to the UNFCCC, the National Adaptation Programme of Action (NAPA), the [Nationally Determined Contributions \(NDC\)](#) and the National Poverty Reduction Strategy Paper (PRSP) are the principal national development/climate change documents linked to this proposal. The country's Second National Communication on Climate Change (SNCCC) reports that both high and low emissions scenarios for climate models downscaled to Guinea-Bissau predict average temperature to increase by about 1.0°C to 2020 under different IPCC scenarios in relation to the average temperatures established for the period 1960–1991. Different to the country's first Communication to the UNFCCC, the SNCCC now highlights the role climatic variability for vulnerability, thus calling for the strengthening of current climate risk management strategies and integration of development needs.

The NAPA (Republic of Guinea-Bissau, 2006) has been instrumental in analysing and prioritising the country's key pressing climate change problems and establishing the foundation for this project. Key results related to this proposal are that (i) the economy is largely dependent on agriculture, whose activity relies on rainfall intensity and regularity, and where cashew is the predominant crop, contributing with 62.6% for the GDP in 2004; (ii) that a large part of population depends vitally on the direct exploration of natural resources for its survival, (iii) a lack of infrastructure in East Guinea-Bissau's regions; (iv) that the country faces difficult economic and social conditions, characterised by extreme poverty and a high unemployment rate; (v) very fragile soils, exposed to rain-driven erosion (vi) expansion of agricultural production associated to forest felling and slash-and-burn practices (itinerant agriculture); (vii) bad soil occupancy, due to a lack of agricultural zoning; (viii) an accelerated destruction of forests, estimated at 30,000-60,000 ha/year, with negative effects on current sequestration capacity estimated at 11,288,401 atmospheric CO₂, (ix) a relatively high rate of population growth (2.05% nationwide, and 4% in the capital, Bissau); (x) water-related problems; (xi) outdated and/or ill applied legislation, or even not applied legislation; (xii) weak or non-existent intervention capacity on the part of institutions; (xiii) absence of protection rules and norms against climate risks linked to the construction of infrastructure; and (xiv) the very precarious nature of traditional housing (made of mud and covered with straw).

The NAPA's project priority list is shown in Table 3. This project principally NAPA priority #1, although for a slightly different region, as per explicit recommendations by national stakeholder involved in the consultation process during this project's development. The project also combines and/or integrates elements of priorities #2 (water supply in Gabú and Bafatá), #6 (impact assessment on producers), #7 (small-scale irrigation), #10 (food security) and #13 (short-cycle production of animals) in the project region in East Guinea-Bissau. Note that the project outlines listed below do not address the central aspect of capacity building on climate change, nor the need to mainstream climate change into national policy and awareness raising. The NAPA prioritisation is also gender-blind. For these reasons, the NAPA priorities in Table 3 were used as a basis for the decisions but not as a blueprint to be used unquestioningly; this takes into account that the knowledge on climate change adaptation and 'windows of opportunity' for action have considerably changed in the years since NAPA publication in 2006. The missing regional focus on Bafatá (5 projects) and particularly Gabú (1 project) 'regions' within NAPA prioritiation would be partially corrected under project implementation.

Table 3: NAPA priorities in Guinea-Bissau

Order of priorities	Project denomination	Geographical intervention zone
1	Support diversification of production and food	Southern provinces
2	Improvement of water supply in rural zones	Other, Bafatá and Gabú 'regions'
3	Capacity building in prevention and protection of mangrove Bolanhas against high-tide invasion	Southern and northern provinces
4	Observatory for mangrove monitoring and evaluation	Northern and southern provinces
5	Monitoring of coastal area erosion	Northern and southern provinces
6	Assessment of impact of climate change in producers' sectors	Nationwide
7	Promotion of small-scale irrigation in Geba and Corubal rivers	Bafatá and Gabú 'regions', other
8	Prevention of natural catastrophes	Nationwide
9	Protection, conservation and enhancement of fishing and coastal resources	Coastal areas
10	Integrated system of information on food security (SISA)	Nationwide
11	Environmental education and communication in coastal areas	Coastal areas
12	Rehabilitation of small perimeters of mangrove soils for rice growing in Tombali, Quinara, Bafatá and Oio	Bafatá 'region', other
13	Support to production of short-cycle animals	Bafatá 'region', other
14	Reforestation of degraded areas	Bafatá 'region'
Total		

Source: Republic of Guinea-Bissau (2006).

In Its quality of Non Annex I Party of the United Nations Framework Convention on Climate Change (UNFCCC), also as a Least Development Country (LDC) and Small Independent Developing State (SIDS), Guinea-Bissau has developed its Nationally Determined Contributions (NDC). This NDC is a reference document for actions in the field of climate resilience in the country. It is inspired on the second generation of the National Poverty Reduction Strategy (PRSP II) aligned with the National Strategic Plan – TERRA RANKA 2015-2025. All these have mainstreamed the priorities of the National Action Plan for Climate Change Adaptation (NAPA, 2006).

The NDC identified the following needs:

- Capacity strengthening has a direct effect on improving decision-making and planning for comprehensive risk management for both public and private actors regarding events associated with climate variability and change in the sectors of forest, water and energy, agriculture and livestock, health, fishing and civil protection.
- Promoting research for development, regional and international exchanges to improve applicability of knowledge acquired by Guineans.

The 2006 National Poverty Reduction Strategy Paper (PRSP) highlights government instability, mismanagement of public funds, and structural constraints in the economy as key issues, including little diversification of income sources, low internal resource availability, weak human capital and lack of private sector dynamism. The PRSP's strategy focuses on a broad spectrum of issues to address these endemic problems, including instigating good governance, battling corruption, improving human rights, building institutional capacity and human resources, and increasing agricultural and fishing productivity alongside improving environmental protection. In addition, the PRSP points to an increasing involvement of well-

informed NGOs and participation of a strong civil society, which can be mobilised to improve social and economic conditions. The present project is therefore in line with the key PRSP recommendations.

How project activities fit with wider local or regional development plans and regional change (government, local NGOs, community and autonomous initiatives such as local small businesses) is a key concern for this project. In this context, the project follows key recommendations of Guinea-Bissau's NAPA, 2nd Communication to UNFCCC (Republic of Guinea-Bissau, 2006; SEAT/DGA and Republic of Guinea-Bissau, 2011), and NDC 2015 as well as those of relevant national strategies and plans along the lines of good agricultural management, improved water management and poverty reduction. For example, the Poverty Reduction Strategy for Guinea-Bissau (PRSP) integrates the agricultural sector's strategies into account in its fight against poverty, while the Charter for Agricultural Development aims to (i) guarantee food security, (ii) increase and diversify agricultural export, (iii) ensure rational management and preservation of agro-sylvo-pastoral resources, and (iv) to improve living standards of rural populations. This includes the dissemination of practices such as promotion of low-cost irrigation systems, production diversification, construction of micro water retention and small dykes for water retention, extension of short-cycle seeds, use of adapted varieties less demanding in water and resistant to prolonged drought periods, etc. The project also contributes to the Gabú and Bafatá sector regional development plans, which focus on livestock and agriculture development. In particular, the integration of climate change adaptation may provide key input to those plans which currently only consider actual climatic variability.

Table 11 gives overview on important plans and strategy papers in Guinea-Bissau and important issues in relation with this project proposal.

Table 11: Guinea-Bissau plans and strategies related to this project proposal

Scale	Name	Key objectives	Important issues in relation with the project proposal
National	Second Poverty Reduction Strategy Paper	<ul style="list-style-type: none"> • Short-cycle seeds • Dissemination of varieties less demanding in water and resistant to prolonged drought periods 	<ul style="list-style-type: none"> • Agricultural development for poverty reduction and increasing food security
National	National Agriculture Investment Plan (NAIP)	<ul style="list-style-type: none"> • Increase in hydraulic works, including construction of micro water retention and small dykes for water retention 	<ul style="list-style-type: none"> • Livestock development and increasing animal feed quality
National	Letter of Agrarian Development (including Letter of Livestock Development, 2011)	<ul style="list-style-type: none"> • Promotion of low-cost irrigation systems • Production diversification • Improvement of grazing fields through introduction of plants with high nutritional quality and greater production potential, especially leguminous species • Promotion and strengthening of production of short-cycle animals (goats and sheep) 	<ul style="list-style-type: none"> • Water resources management • Lack of climate change adaptation integration • Setting up of an Early Warning System against climatic risks

The activities proposed to be implemented under this project respond to the needs identified by the NDC. The interrelationships between the needs of the NDC and the activities of the project are presented in the following table :

Table 12: Interrelation between Guinea Bissau needs identified by NDC and project activities

Needs identified by the NDC	Project activities that meet the needs identified by the NDC
Capacity strengthening has a direct effect on improving decision-making and planning for comprehensive risk management for both public and private actors regarding events associated with climate variability and change in the sectors of forest, water and energy, agriculture and livestock, health, fishing and civil protection.	<p>The project proposed, among other things, the following activities to meet the needs of the NDC:</p> <ul style="list-style-type: none"> - Output 1.1.1. Socio-climatic vulnerability assessment for East Guinea-Bissau - Output 1.1.2 Technical capacity needs assessment for ministry and field operatives - Output 1.1.3 Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources - Output 1.2.1 Technical trainings on adaptative systems and organizational capacity building for NGOs and identified target groups - Output 1.2.4 Support for famers groups by the government technical experts for adaptation actions implementation - Output 1.2.5 Capacity building to prevent forest fires - Output 3.1.3 Manual and other materials on best practices and measures for climate-smart agriculture are developed.

	All these activities will strengthen the capacity of the actors and that of the country in different sectors.
Promoting research for development, regional and international exchanges to improve and improve applicability of knowledge acquired by participants.	<ul style="list-style-type: none"> - Output 2.1.3 Rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs, machinery and tools. This activity includes the introduction of improved seeds with the collaboration of the National Institute for Agronomic Research (INPA), - Output 3.1.1 Knowledge management strategy developed - Output 3.1.4 Dissemination of results to other regions of Guinea-Bissau and West Africa

It is important to note that the present project proposal has synergies and complementarities with other relevant recent or on-going programs in agriculture and water management in the planned target regions of Gabú and Bafatá, not limited to adaptation to climate change. These synergies and complementarities occur in the following domains: (i) improvement of technical and institutional capacity of stakeholders; (ii) increase of agricultural productivity and food security; (iii) construction of water infrastructure; (iv) management of natural resources; and (v) diversification of crop production.

In the domain of (i) improvement of technical and institutional capacity of stakeholders, the proposal project enter in complementarity with:

- *Rural and Agricultural Sector Rehabilitation Project* (PRESAR) supported by the African Development Bank. PRESAR's three objectives include the strengthening of rural organizations' capacity to support small-scale farmers and infrastructure in several Regions of Guinea-Bissau, including Bafatá and Gabú;
- The *Intensification and Valorization of Local Agricultural Products* project (DIVA) from 2008-2011 (US\$ 1.500.000). Carried out with support by the Italian Government in both Bafatá and Oio regions, the project helped in the capacity building of producers and their institutions;
- UNJP/GBS/301/PBF *Gender Promotion Initiative* (until 2015) with a US\$ 146,796 budget aimed to improve economic security and women's rights including in rural areas, investing in initiatives that ensure their economic and social empowerment through small-scale business activities; promotion and protection of women's rights and strengthening of organizational capacity of coordinating institutions;
- The *Local Governance and Income Generating Activities* support project was financed by the Dutch government from 2010-2013 with US\$200,000. The project aimed to improve governance by local communities and them in developing income-generating businesses and activities that would contribute for the improvement of their living conditions. Measures included micro-credit for agricultural and livestock production, provision of agricultural training, and technical assistance to prepare community plans.
- UNDP/GEF *National Capacity Self-Assessment* (2009-2011) made important progress in assessing the national capacity to implement the Rio Convention and developing a Strategy and Action Plan for Capacity Building on Environment Management, points that have directly contributed to the LDCF project development.

In the domain of (ii) increase of agricultural productivity and food security the proposal project has synergies and complementarities with the following projects:

- Several initiatives coordinated by the UN's Food and Agriculture Organization (FAO), including the International Fund for Agricultural Development (IFAD). FAO is implementing a number of projects, programs and initiatives that support Guinea-

Bissau in the implementation of the Charter for Agricultural Development Policy, its action plan and what is part of the National Program of Food Security. FAO has projects in the whole country and also in the two project regions. It is worth mentioning two particular interventions: (1) The Food Security Project, which targets a number of policy, structural and on-ground interventions to address the now recurring issue food security in Guinea-Bissau; (2) Project for diversification and intensification of agriculture and valorization of agricultural production;

- GCP/RAF/461/SPA *Strengthening Capacity of ECOWAS for Effective Comprehensive Africa Agriculture Development Program (CAADP)*. Implementation in West Africa (until 2015) aimed to improve the food security and nutrition situation in West African States and concrete progress of ECOWAS Member States towards achieving the UNMDG1, measured by increased and sustained agricultural growth in line with the six percent CAADP annual agricultural growth target (US\$4 million);
- TCP/SFW/3402 *Support to Policy Initiatives for the Development of Livestock/Meat and Dairy Value Chains in West Africa* (end 2014). The project with a US\$ 500.000 budget aimed to subsidize the creation of a suitable environment for the development of value chains for livestock and livestock products to achieve food security, poverty reduction and reduction of dependency on food imports. A successful implementation of the project would contribute also to integration of livestock producers into markets, job creation, improvement of living standards and sustainable increase of livestock production and productivities. The envisaged impacts of the project were in line with the objectives of ECOWAP. The project impact is also in line with the objectives of MDG, FAO's Strategic objective B and the Priority Area 1 of FAO Africa;
- WB/EU Emergency Project for Food Production (2009-2012) with an approximate budget of \$9 million, and other recent/ongoing emergency programs. The mentioned project sought to assist the recovery of 5,000 hectares of mangrove soils and lowland continental soils for rice growing and vegetable production. The aim was to increase rice production and reinforce food security at community level;
- UNDP's *Community-Based-Organizations' Support Project* in Gabú Region (OCB) (2008-2012). This project was financed from UNDP core funds for \$1.5 million and its implementation extended from 2008-2012. The project was active in the Gabú region and wanted to support several local community-based-organizations' members to develop agrarian production (crops and livestock) for their self-sufficiency, thus improving their food security;
- Project for agricultural production in urban and peri-urban areas which includes the (i) development of operational plans for the improvement in short-cycle animal husbandry in the wildlands (including Gabú and Bafatá regions), (ii) implementation of micro-projects for breeding, processing and marketing of animal products, and (iii) development of partnerships with private sector and support services (until 2016);
- Several other programs (e.g. by the Ministry of Agriculture) aim to retrieve former production values for cashew nuts and rice, with a particular focus on women's integration in the production chain. Further initiatives focused on community development and rural rehabilitation in Guinea-Bissau.

Regarding to the domain (iii) construction of water infrastructures, the proposal project has strong links to the following programs and projects:

- The Rural and Agricultural Sector Rehabilitation Project (PRESAR) which is implemented by the Ministry for Agriculture and Rural Development of Guinea-Bissau (MADR) with support from the African Development Bank. PRESAR three objectives include the reorganization and rehabilitation of water and agrarian structures.
- The proposal project also enters in synergy with the Program of Work of the General Directorate for Water Resources (DNGHR). Within the framework of the Sub-Regional Program to Fight against Poverty, the Government of Guinea-Bissau has been

receiving significant finance for water resource management, as a member of UEMOA (the West African Monetary Union) and from OMVG (the Basin Organization for the Management of the Gambia River). One of wwo interventions are particularly relevant to mention: (i) UEMOA's Rural Hydraulics Program in Guinea-Bissau, under which a total 300 water points are foreseen to be built, 50 of which are in the Gabú Region, plus a community capacity strengthening program on self-sustained was point management, including sensitization and training in hygiene and basic sewerage; (ii) Integrated water resource management for the hydrographical basins of river Kayanga-Geba, financed through a grant, within the framework of African Water Facility, under which it is foreseen that an Integrated Water Management Plan for the Kayanga-Geba basin will be prepared, as well as the financing of studies for the exploration of basin's irrigation potential with respect to the part of the various river that flows into Guinea-Bissau. The Kayanga-Geba basin is located in the same sites selected for this project application (project running until 2017).

With regards to biodiversity conservation, as fragmentation and pressures on natural resources increase throughout West Africa, areas such as Guinea-Bissau's Forest Belt have become important refuges for threatened species, providing also important national and transnational biological corridors and migration routes for large mammals in the region. In this domain of (iv) management of natural resources principal complementarities are with these projects and programs:

- The UNDP/GEF Project SPWA - *Support for the Consolidation of a Protected Area System in Guinea-Bissau's Forest Belt* project which supported the consolidation of protected areas (PAs) in the Forest Belt through establishment on an interlinked protected area system containing of two inland PAs (Boé National Park, Dulombi National Park) and three biological corridors (Tchetche, Cuntabane-Quebo, and Salifo), located at the junction of Gabú, Bafatá and Tombali 'Regions' in central south Guinea-Bissau. Furthermore, the project supported preliminary assessments on primary threats to biodiversity, including its root causes; undertook a detailed stakeholder analysis for PA implementation; and carried out an initial assessment of climate change risk on Guinea-Bissau's biodiversity. This latter study highlighted potentially disastrous impacts on land, water, and forest resources, with strong relevance for rural livelihoods across the entire Forest Belt region. This projects build on the findings of the GEF/UNDP-3650 project in that it (i) targets key root causes identified (persistent rural poverty, weak institutional capacity and lack of coordination among authorities) through small-scale productive interventions and mainstreaming of adaptation into development planning; and (ii) reduces potential environmental pressures on the Forest Belt via conservation agriculture and agroforestry (including positive impacts via reduced slash-and-burn agriculture). In cases where project beneficiaries are located near or around the Forest Belt, rural extension and capacity building components will be used to incentivize beneficiaries to prevent deforestation and overuse of natural resources. Potential subprojects near the project belt will shortlisted as soon as the project starts in order to allow for timely implementation of these actions.
- UNDP/GEF *Sustainable Land Management Project* SLM. With a total budget of less than \$0.5 million, the long term aim of the project is to contribute to the recovery of degraded land through institutional and individual capacity building. It is doing so by integrating sustainable land management issues into national development strategies, completing the National Action Plan to Combat Desertification (PAN/LCD), reinforcing, harmonizing and integrating the institutional, technical, organizational and legal capacities in the policy for SLM.
- The Rural and Agricultural Sector Rehabilitation Project (PRESAR) which is support by the African Development Bank. One of tree objective of PRESAR focuses on capacity

building in integrated natural resource management and land management at the level of villages.

Regarding (v) diversification of crop production this proposal enters in complementarity with:

- The *School Horticultural Activities Support Project* which is developed in collaboration with World Food Program (WFP). This project targets, among other, 50 schools in the Gabú region and aims to diversify and intensify of agriculture as well as valorization of agricultural production.
- The *Intensification and Valorization of Local Agricultural Products* project (DIVA) from 2008-2011 (US\$ 1.500.000) which also focuses on the intensification and diversification of agricultural production in Guinea-Bissau.

Regarding livestock production, this project will enter in complementarity and synergy with the Green Climate Fund/BOAD project « Strengthening livestock resilience to drought in Guinea-Bissau (US \$ 10 millions) » identified and which is currently in the process of formulation. The project aims to increase the resilience of livestock production to the adverse effects of climate change in north-eastern and north-western of Guinea Bissau.

Although the Adaptation Fund project is a scaling-up of the LDCF project, and has addressed the issue of livestock, the contribution of the project to meet the resilience needs of livestock has been weak in relation to the population demand and the needs of the livestock sub-sector. In fact, during the public consultations carried out as part of the preparation of the Adaptation Fund project and during the validation workshops, the population raised problems and concerns related to the livestock sector and strongly requested support for the development of this sector in the face of recurrent droughts and resource management conflicts, particularly from transhumance. In fact, the majority of farmers do not have the means to mobilize water for livestock. Only 23% of livestock have access to drinking water, and this tends to decrease with the increase in livestock. Conflicts between herders and farmers in the management of natural resources are then frequent. During the dry season, transhumance, considered as a solution to escape the loss of livestock, mobilizes young people, children and adults throughout the season. Pastoral trails or transhumance corridors are not definitely defined and grazing is done without rules, leading to negative impacts on agriculture, water and natural resources followed with conflicts that sometimes affects the safety of populations. These concerns have been mentioned in Table 15 of Section H. PART II of this full proposal.

It is therefore during the public consultations and preparatory workshops for the Adaptation Fund project that exchanges between members of government, farmers, farmers, NGOs and local traditional enterprises led to the identification of the Project "Strengthening Resilience of Livestock to Drought in Guinea-Bissau". The project was selected as a priority to be financed by the Green Climate Fund. It is included in the working program of the Green Climate Fund and the BOAD as an implementation entity. It aims to achieve the resilience of livestock in the face of the drought that continues with the lack of water and lack of forage especially in the North and East part of the country which house 86% of the national herd. This pilot project intends:

- mapping the areas most affected by lack of grazing and water in the dry season;
- to identify conflicts between livestock breeders and farmers on the paths taken by pastoralists and their livestock for transhumance;
- strengthen the national legal and strategic framework for transhumance management;
- sensitizing breeders and farmers on the coordinated management of water, land, forest and other ecosystems;
- gradually stabilize livestock breeders through the development of grazing and the establishment of hydraulic infrastructure for livestock watering (this stabilization will begin with this project and will continue gradually with future projects.) ;

- define the pastoral routes and transhumance corridors, along which hydraulic infrastructures (water reservoirs and drilling with human power) will be installed. It will also be introduced along these courses of forage species.

The GCF project is not a scaling-up of the Adaptation Fund project. It is identified to strengthen livestock resilience actions in areas not covered by the Adaptation Fund project and to limit livestock migrations, which is a source of conflict between livestock breeders and producers. If implemented, it will allow livestock in areas not covered by the Adaptation Fund project not to migrate to areas of the AF project in search of grazing and water.

The project will be implemented in administrative sectors other than Pitche, Pirada, Gabú, Sonaco, Contuboeil and Ganadu which are already covered by the present AF project. The intervention areas of the GCF project will include, among others, the following sectors: Bissorã, Farim, Mansaba, Mansôa, Nhacra in the region of Oio, the sectors of Bafatá, Bambadinca, Galomaro, Xitole in the region of Bafatà and the sector of Boé in the region of Gabù.

The present GCF project is currently under development and will take at least 18 months to be approved by the Green Climate Fund Board. Its implementation will start at the earliest in 2019 or 2020.

If the implementation of this Adaptation Fund project begins in 2017, it is possible that within two years, prior to the implementation of the GCF project, lessons learned from experiences related to: (i) capacity building of breeders, public service workers, NGOs and Associations; (ii) management of pasture; (iii) availability of water for livestock watering; and (iv) the management of water reservoirs for flood control, can help better plan, manage and monitor the GCF project.

The two projects will therefore not be implemented in the same areas (administrative sectors) at the same time and will not present any overlap but could be complementary.

Table 13 below summarizes the key overlaps and potentials for synergies between the present project proposal and other relevant initiatives in agriculture and water management in Guinea-Bissau, and puts these overlaps in context with the expected outcomes of this proposal. What becomes clear is that climate resilience and adaptation are yet little integrated in development projects in the country, highlighting the importance of this present proposal.

Table 13: complementarities and synergies of the proposed project and with other initiatives in Guinea-Bissau

Expected outcomes of this project	Possible complementarities and synergies with the activities of similar projects and programs implemented in Guinea Bissau:					
	Improvement of technical and institutional capacity of stakeholders	Increase in productivity and food security	Construction of water infrastructure	Management of natural resources	Diversification of crop production	Livestock resilience
	<p>(i) UNDP/GEF National Capacity Self-Assessment; (ii) UNDP/GEF Sustainable Land Management Project SL; (iii) Project against poverty. Local Governance and Income Generating Activities Promotion Support Project;</p> <p>(iv) The UNJP/GBS/301/PBF Gender Promotion Initiative; (v) UNDP's Community-Based-Organizations' Support Project in Gabú Region (OCB); (vi) UNDP/GEF Project SPWA - Support for the Consolidation of a Protected Area System in Guinea-Bissau's Forest Belt; (vii) The WB/EU Emergency Project for Food Production; (viii) The TCP/SFW/3402 Support to policy initiatives for the development of livestock/meat and dairy value chains in West Africa; (ix) GCP/RAF/461/SPA Strengthening Capacity of ECOWAS for effective Comprehensive Africa Agriculture Development Program (CAADP) Implementation in West Africa; (x) Rural and Agricultural Sector Rehabilitation Project (PRESAR); (xi) Project for diversification and intensification of agriculture and valorization of agricultural production; (xii) The School horticultural activities support project; (xiii) The Food Security Project and (xiv) Program of Work of the General Directorate for Water Resources (DNGHR); (xv) GCF/BOAD project : Strengthening livestock resilience to drought in Guinea-Bissau</p>					
Increased technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions	X					
Family farmers, development professionals, and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning			X	X		X
Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security		X	X		X	X
Sustainable climate-smart agriculture practices and management is adopted in comparable regions of the country and West Africa, and disseminated to other West African countries, contributing to resilience and						

development needs in those regions						
International negotiations on climate change adaptation recognize and integrate new knowledge on climate-smart agriculture in LDCs in their policies and practices						

Otherwise the project's objectives have strong linkages to the Second National Health Development Plan of Guinea-Bissau, as well as the Millennium Development Goals (MDG) to eradicate extreme poverty and hunger, reduce child mortality, and ensure environmental sustainability. Finally, the project is also in concordance with the 'regional' development plans of Gabú and Bafatá and related documents which highlight the importance of livestock and agriculture in their economy and call for further actions to strengthen these sectors against climatic extremes such as droughts or floods. Water management is also discussed extensively in both 'regional' plans.

E. Describe how the project / program meets relevant national technical standards, where appropriate, such as environmental assessment standards, building codes, etc., and complies with environmental and social policy of the Adaptation Fund

The project will comply with all relevant standards in the areas of agriculture, water resources, small scale water retention, and natural resources management, and small infrastructure, as well as environmental and social standards.

The project is in compliance with the national environment and social regulations, the E&S principles of the Adaptation Funds and with the Environmental and Social Safeguards of West African Development Bank (BOAD), which are aligned with GEF's and World Bank's Environmental and Social safeguards.

The current proposal complies with relevant standards in Guinea Bissau such as:

- The Land Law (5/98, 1998);
- Water Code (5a-92, 1992);
- The Law on Environmental Impact Assessment (EIA) (10/2010);
- The Framework Law on Protected Areas (3/97, 1997);
- The Basic Law of the Environment (1/2011) and the Forestry Law (5/2011);
- Second Poverty Reduction Strategy Paper;
- National Agriculture Investment Plan (NAIP) ;
- Letter of Agrarian Development (including Letter of Livestock Development of 2011);
- National Strategy for Protected Areas and Biodiversity Conservation (2014-2020);
- National Action Program on Fight against Desertification (under discussion);
- Forest Master Plan and Forest Law;

- Water Master Scheme;
- National Health Development Program II.

One important problem that continues is that local customs and law are often distant from existing legislation. A second important problem is a lack of legislation, as in environment and in the water sector, that defines the property of hydraulic structures, rights and obligations of users and state and especially governs the principle of recovery of utility costs (tax on water and wastewater) (Guinea-Bissau, 1998). The Direcção Geral de Florestas e Fauna (DGFF) is responsible for application of the Water Code (5a-92, 1992) and technical norms on execution of other hydraulic works, and also applies taxes and fees exist for selling of forest products, felling of trees, illegal chase, prevention of slash-and-burn agriculture etc. But low enforcement of existing legislation strongly affects adherence and compliance to standards in the sector of agriculture, water and natural resources management, and small infrastructure.

Guinea Bissau is a state member of the BOAD. Since 2013, BOAD has strengthened its environmental and social safeguards to comply with the requirements of GEF. The list of operational policies and guidelines and applicable procedures in this area of this project proposal is attached. Moreover, based on the Environmental and Social Management Framework (ESMF) carried out for the full proposal, national policies and regulations will be enhanced or drafted, disclosed and implemented at national and local level to fill gaps caused by deficiencies of standards in the sectors of agriculture, water, natural resources management, small infrastructure, environmental and social management.

In response to conflicts between local customs and law, the proposed project will develop a strategy with relevant institutional partners and RCCF to ensure that relevant standards are understood by project beneficiaries and applied at project level (Eg prevention of illegal burning or hunting) by the village authorities and the beneficiaries themselves. This strategy will be based on presentations to village councils, women's associations, development of small textbooks, etc.

Conflicts between local customs and the relevant right to this project request will be identified by the relevant local and regional authorities and government agencies (water resources, forestry, other) and RCCF. On the other hand, the project will help to improve or draft, validate and approve national guidelines on water retention / dam safety, involuntary resettlement, land use, management Forestry, pest management, indigenous peoples, natural habitat, physical cultural resources, public participation in the process of environmental impact assessment and gender mainstreaming. [The project will also help to develop/improve principles of the Adaptations Funds as: Equity and access, Gender Equity and Women's Empowerment, Marginalized and Vulnerable Groups.](#)

Six (6) partnership protocols which were signed by the LDCF project team with relevant institutional partners in the areas of water resources management, small infrastructure, environmental and livestock and agriculture will support this process. These partnership protocols include:

1. The Directorate General Agriculture, particularly for training activities and dissemination of improved agricultural techniques, and studies of irrigation schemes shallows;
2. The Directorate General of Livestock, especially for training on hygiene, health and animal feed and livestock vaccination campaigns;
3. The General Directorate of Water Resources (DGRH), including water resources management activities and construction of boreholes and wells in villages;
4. The National Institute of Meteorology (INM) as part of the rehabilitation and equipment of the meteorological station Bafatá, construction and equipment of the meteorological station of Gabu, the establishment of 4 stations Pirada assistants, Buruntuma, Canquelifa Chih-Chih and the establishment of a rainfall station in each of the 14 villages targeted by the project, and the strengthening of INM staff capacity;

5. The National Institute for Agronomic Research (INPA), for improved seed development activities of rice production and the provision of improved seeds; and

It is planned to expand upon existing partnerships and develop further partnerships (e.g. DGFF) in the AF proposed project.

For planning and construction in the water, agriculture and livestock existing benchmarks will be utilized for dimensioning infrastructure works (e.g. wells, small-scale water retention, and small-scale dams). Annual average gross needs for irrigated crops in the dry season are roughly evaluated at 7.000-8.500 m³/ha, and at 3.500-7.000 m³/ha for rice during its phenological cycle. Unit water requirements for animals on average are estimated at 25 l/day/head for cattle, 5 l/day/head for sheep, 7 l/day/head for goat, 5 l/day/head for pigs, 0.2 l/day/head for chicken (DGRN, 1998). Concerning village water management existing standards on construction of new water points will be followed. This includes the necessity of hydrological and feasibility studies (socio-economic, demand, capacity, existence of public interest), administrative authorization processes, the constitution of village water management committee, information to the public, health education and periodic monitoring, with inclusion of stakeholders. Specifically water points will need to be constructed within a 500 m diameter from the village, but not in the village in order to avoid pollution risks. Furthermore it is ruled that the community retains ownership of the land around the water point and that any activities or constructions within a radius of 25 m around the waterhole which could threaten water quality (latrines, water troughs or washing and laundry) are prohibited.

The Adaptation Fund's principles and the National standards required by the Government of Guinea Bissau, including environmental impact studies, laws and regulations related to water, land management as well as guidelines for the agriculture and irrigation codes have been taken into account.

Table 14: National texts applicable to the project and correlation with AF's principles.

AF principles	Corresponding national standards	
	National text enacting the standard	Standard
<i>Compliance with law</i>	Law No. 1/2011 of 2 march 2011 constituting framework law on environmental	Article 2: This law has the objective of defining the legal basis for the use and proper management of the environment and its components, for the materialization of a sustainable development policy of the country
	The Environmental Assessment Act approved by the Government, at the session of the Council of Ministers of 19/03/08	This law is a fundamental preventive instrument of environmental policy. It enshrines the promotion of sustainable development, balanced management of natural resources, while ensuring the protection of the quality of the environment, contributing to the improvement of the quality of life of the man.
<i>Equity and access</i>	Constitution of the republic of Guinea-Bissau, adopted in 1984 and amended in 1991, 1993, 1996	Article 24: All persons are equal before the law, enjoy the same rights and are subjected to the same duties, without distinction as to race, social status, intellectual or cultural level, religious belief or philosophical conviction. Article 32: All citizens have the right of access to judicial organs to seek redress for violations of their constitutionally recognized rights and the law. Justice cannot be denied on economic grounds.
	Law No. 1/2011 of 2 march 2011 constituting framework law on environmental	Stipulates in its article 4 Alina 1: Everyone has the right to a human and eco-environment equilibrate the duty to defend, leaving it to the State, through the own body and appeal to popular and community initiatives, promote the improvement of the quality of individual and collective life.
<i>Human Rights</i>	Constitution of the republic of Guinea-Bissau, adopted in 1984 and amended in 1991, 1993, 1996	Article 24: All persons are equal before the law, enjoy the same rights and are subjected to the same duties, without distinction as to race, social status, intellectual or cultural level, religious belief or philosophical conviction. Article 32: All citizens have the right of access to judicial organs to seek redress for violations of their constitutionally recognized rights and the law. Justice cannot be denied on economic grounds.
<i>Gender Equity and Women's Empowerment</i>	Constitution of the republic of Guinea-Bissau, adopted in 1984 and amended in 1991, 1993, 1996	Article 25: Men and women are equal before the law in all aspects of political, economic, social and cultural life.
<i>Marginalized and Vulnerable Groups</i>	Constitution of the republic of Guinea-Bissau, adopted in 1984 and amended in 1991, 1993, 1996	Article 24: All persons are equal before the law, enjoy the same rights and are subjected to the same duties, without distinction as to race, social status, intellectual or cultural level, religious belief or philosophical conviction. Article 32: All citizens have the right of access to judicial organs to seek redress for violations of their constitutionally recognized rights and the law. Justice cannot be denied on economic grounds.
<i>Core Labour Rights</i>	Constitution of the republic of Guinea-Bissau, adopted in 1984 and amended in 1991, 1993, 1996	This law stipulates in article 46 : (1) Workers have a right to protection, security and hygiene at work.

	Law No. 1/2011 of 2 march 2011 constituting framework law on environmental	Article 31 is dedicated to Protected areas, reserves, sites, ensembles and Classified Objects.
	Ordinance No. 045 / PRG / 87: Code protection and enhancement of the environment	Article 4: The Guinean environment is a natural, integral part of the universal heritage. Conservation, maintenance of resources it offers to human life, the prevention or limitation of activities that degrade or impair the health of persons and their property are of general interest.

F. Indicate whether the project / program is already financed by other sources

This project is the currently the first integrated approach to scale-up climate-smart agriculture practices and planning across the two highly vulnerable regions in East Guinea-Bissau while contributing to institutional capacity building. The project components are based on the experiences GEF/UNDP project “Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau” (00077229), but will go beyond in terms of regional scope, integration of new agricultural technologies and the scope of monitoring & evaluation (M&E) and knowledge dissemination. GEF/UNDP project 00077229 is foreseen to end its activities by end of 2015 so that duplication of funding sources can be excluded. Other existing water and agriculture initiatives by government and NGOs in Gabú and Bafatá ‘regions’ do not currently integrate climate adaptation and resilience into their overall framework. These initiatives will be built upon for improved dissemination of project successes.

G. Where appropriate, indicate whether the project includes a training component and knowledge management to take stock of lessons learned and reapply them.

A specific component #3 (“knowledge management of lessons learned on climate-smart agriculture and adaptation planning”) is included in the project, focusing particularly on outreach and information exchange. As detailed in section II.A of this proposal, different knowledge materials (manual, tools box, project website, newspaper media, calendars, conference presentations, etc.) will be produced for specific target groups (policymakers, field workers, farmers, scientific community, etc.), integrating practical lessons on climate-smart agriculture and water management in dryland regions. Further outreach will also occur at inter-ministerial meetings and COP/UNFCCC meetings. DGA/SEAD is the lead institution of this component.

The project monitoring and evaluation system will contribute significantly to technology performance management and traceability of transactions that have achieved the outcomes and decisions useful to action.

The results (outputs, outcomes and impacts) and lessons learned from the implementation will be: i) capitalized and archived electronically and physically in a documentation center and ii) shared/disseminated in various forms adapted to different target group.

All communication material on the project will bear the logo of Bissau Guinea, the Adaptation Fund and the BOAD.

H. Describe the consultation process, including the list of stakeholders consulted during the preparation of the project, with particular reference to vulnerable groups, including gender considerations, in accordance with the environmental and social policy of the Adaptation Fund

Public consultation during the preparation of the project, were conducted in accordance with the requirements of the Adaptation Fund. This consultation took place in several phases:

- a first consultation was carried out during the preparation of the project concept note (PCN);

- a second consultation during the study on lessons learned from the LDCF project being completed;
- a third in the identification of the potential sites of the project; and
- a fourth in the preparation of the Full Project; and

The objective is to seek the views of the beneficiaries and to collect the basic information to enable better design of the project with particular implication of vulnerable groups, elders, women and youth.

The main objective of this approach of information, communication and participation of stakeholders was to create a mutually beneficial exchanges, favorable to an open dialogue with the aim of: (i) ownership of the project by beneficiaries at the stage of preparation and planning; (ii) the consideration of the concerns of all stakeholders including vulnerable groups (women, youth, children, etc.) in the design and implementation of the project; (iii) exchanges on financing and project sustainability.

During the project preparation a literature review was conducted. Interviews with person resource working in different ministries and structures involved were made. Field visits (potential sites and sites in exploitation) and interviews with the beneficiaries were made. This helped to establish in a participatory manner the context of project development, problems to solve, the types of adapted solutions, etc. and the consideration of the problems of vulnerable populations.

a) Public consultation during the PCN preparation

The consultative process for project development built upon networks established under the NAPA and SNCCC, and furthermore GEF/UNDP project "Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau" (00077229). Workshops and meetings have been held in Bissau with various Ministries and institutions, in addition to consultations with the project region's Rural Climate Change Forum (RCCF, see section III) and other local/regional authorities. Furthermore, a one-week field trip was organized by DGA/SEAD in 2015 in order to receive feedback on planned project activities and needs. The field visit focused on extremely poor communities and women integration (either organized in associations or not) which are a focal objective under this project.

In each village visited, following local customs, the project team began by asking the village head for permission to present the project idea and then asked him to call all household heads to participate in a group focus meeting. Talks were conducted in Guinea-Bissau Kriol by the project team or in any local language/dialect when participants of the team were not fluent in the vernacular language. These meetings included clear presentations of the project idea and objectives as well as a stocktaking of household/village needs (focusing at the intersection agriculture, water resources and climate risk management). Through this approach the precise adaptation strategy choice is being made by the communities themselves – following the example from the World Bank's approach and that of others, which do not specify activities before workshops, NGO projects and a typology list of activities that could be discussed at community level. Women's participation and empowerment through the project was also discussed openly where elders or the village head judged this as problematic.

The list of stakeholders consulted during the one-week field trip can be found in Annex 6. Figure below consists of four photos taken at these meetings; they give the idea that voice and

opinion of women and poor were promoted during the consultation process. During these series of consultations, the gender element was very present (see figure below).

Figure 25 : Participation of stakeholders during consultative phase for PCN preparation in four tabancas

b) Consultations during the study on lessons learned from the LDCF project

This public consultation took place in the villages benefiting from the project. The purpose of the meetings held in villages benefiting from the LDCF project is to share with the beneficiaries the experiences and lessons learned from the project (technical and organizational strengths and weaknesses). The objective is to collect the beneficiaries' assessment of the project. The approach adopted and the free exchange between beneficiaries on the one hand and between beneficiaries and the study team on the other hand. This enabled beneficiaries to identify successes, failures and areas for improvement. The following pictures illustrate the public consultations in some of these villages.

[Figure 26](#) : Public consultation in the village of Bajocunda during the lesson learned study

[Figure 27](#) :Public consultation in the village of Copa Mango during the study on lessons learned

c) Public consultation during potential sites identification

During the identification of potential sites for the project, several villages were visited and consultations with the local populations were carried out. The objective was to share the ideas of the project with these populations, to inform them of the possibilities offered by the project. In each village, the sites that could be put into values were visited. Following this series of site visits and public consultations, 18 potential sites were identified at this stage. Additional technical and technical studies will make it possible to define a list of sites to be developed within the framework of the project. It should be noted that a call for applications will be launched for the final selection of sites on the basis of criteria which will take into account vulnerable groups, forests, protected sites, etc. The preliminary report identifying potential sites is attached as Annex 4 to this document.

d) Public consultation during the Full Project formulation

During the preparation phase of the Full project, a broad consultation of stakeholders involved in the project was conducted. In potential villages affected by the project, meetings with local populations were organized in order to exchange with them on aspects of the project, their

opinions and their concerns. These meetings were attended by nearly 500 people in all. Village chiefs were heavily involved in public consultations. Exchange meetings were held in Bissau, Gabù and Bafatà. These meetings have gathered the heads of various sectors involved in the project. This is, among others, in charge of services: the environment, agriculture, forest and wildlife, livestock, fisheries, civil defense, health, meteorology, NGOs, etc. Meetings were also held with regional Governors and sectoral administrative authorities. So the team met with the Governor of Gabù, the Governor of Bafatà, the Administrator of Contuboel sector (Bafatà Region), the Administrator of Pirada sector (Region Gabù), the Secretary of the Administrator of Bambadinca sector (Bafatà Region), etc.

Figure 28 : Meeting with technical services in Gabù

In the villages a strong mobilization was observed. In the villages visited, the populations welcomed the project.

Figure 29 : Public consultation during the preparation of the Full project

Concerns raised by the populations during the public consultations

During these series of public consultations, populations have raised, apart from questions of vulnerability to climate change, food insecurity, poverty and malnutrition, concerns about agriculture, farming, forest management and drinking water supply. These concerns and their consideration in the project are summarized in the table below.

Table 15: Concerns raised by populations during public consultations and their consideration

Sectors	Concerns raised	Taken into account in the project
Agriculture	Lack of water for the development of agriculture	The project provided under component 2, the implementation of the infrastructure of mobilization of water for irrigation (outputs 2.1.1 and 2.1.2)
	The inundation of the lowlands	Infrastructures to fight the flooding of agricultural land have been planned at the level of outputs 2.1.1 and 2.1.2.
	The silting up of the shallows	The project was included in the development of irrigation infrastructure, landscaping of the slopes against the silting up of the shallows through reforestation with plants adapted under the supervision of the Direction of waters and forests. (outputs 2.1.1 and 2.1.2)
	The delay of the rains and the early drought which occurs most often during the flowering of the crops	<p>The mobilization of water is expected to extend its availability and cover the entire agricultural campaign (outputs 2.1.1, 2.1.2 and 2.1.4)</p> <p>The project will work in collaboration with the meteorological services for reliable information and better plan for the crop year. A suitable agricultural calendar will be established for this purpose. The gauges will be acquired under the project and installed in areas/villages of interventions to have rainfall records (output 2.1.5 (b)).</p> <p>The project also provided for the extension of short-cycle and drought-resistant seeds (output 2.1.3.2).</p>

Sectors	Concerns raised	Taken into account in the project
	The decline in the fertility of some soil on which agriculture is developed	<p>The project has programmed under the Output 2.1.3 actions to improve the fertility of the soil and the promotion of the production of manure to reduce the demand for chemical fertilizers.</p> <p>The courses are scheduled to build the capacity of producers in the use of fertilizers and pesticides (output 1.2.4).</p>
	Lack of access to inputs (seeds, fertilizers, pesticides) quality	<p>The project has planned, under the Output 2.1.3 to grant support to farmers for access to quality inputs. The actions summarized in:</p> <ul style="list-style-type: none"> - support groups for the acquisition and the multiplication of quality seeds and construction of seed banks (2.1.3.2) - Support for the purchase of fertilizers and pesticides of quality (2.1.3.3). <p>Courses are planned at the place of the producers for the multiplication of seeds with the support of the National Institute of the agrarian research (INPA).</p>
	Attacks of crops by pests and others leading to a partial loss of crops.	Support for the acquisition of quality pesticides (output 2.1.3.3) and the capacity building of producers for better treatment plant (output 1.2.4) will better protect crops.
	Lack of materials and equipment for production and development of products	The project will provide support to producers for the acquisition of 20 tillers, 1000 weeders, 60 yoked oxen and 20 hullers (Output 2.1.3.5). This activity will be conducted for demonstration.
Breeding	Lack of fodder and water for livestock with serious implications for the livestock production and income for farmers	<p>The project provided support to the development of pasture and the production of the dry feed from brachiaria and other nutritious plants. Farmers will be trained on the techniques of forage production. Sheds for storage of dry fodder for feeding cattle in the dry season are planned in each area of intervention. Support will be provided to groups of breeders for their specialization in the production of seeds of brachiaria (Output 2.1.3).</p> <p>The project foresaw the realization of infrastructure of water supply for livestock under the output 2.1.2. There are access ramps to the Cocoli River by cattle (output 2.1.4).</p>
	Lack of corridors of transhumance leading to conflicts between farmers and agriculture	<p>The implementation of the Outputs 2.1.2 ; 2.1.3.4 and 2.1.4. will stabilize the livestock and reduce conflicts between farmers and ranchers and transhumance.</p> <p>One project « Strengthening livestock resilience to drought in Guinea-Bissau» (Green Climate Fund/BOAD project) is identified and currently in the process of formulation to increase the resilience of livestock production to the adverse effects of climate change in</p>

Sectors	Concerns raised	Taken into account in the project
		north-eastern and north-western of Guinea Bissau. This project will address issues related to transhumance corridors (see more informations on pages 83-84).
Forests	Destruction of forests and plantations by Bush fires	It is planned to create brigades to fight bush fires and the capacities of committees of vigilance on Bush fires (output 1.2.5). These brigades and committees whose capacities to intervene are reinforced, will undertake the campaigns of sensitizing the populations on the fight against the bush fires and the techniques of fire. Awareness for the fight against the practice of slash and burn agriculture which is one of the causes of forest fires, will reduce this phenomenon.
Drinking water supply	Difficult access to drinking water in the villages	Access to drinking water will be improved under the output 2.1.4. Drinking water wells will be carried out in the villages that do not yet have access to drinking water. 30 drilling will be carried out to improve the supply of water to the populations.

All the concerns raised during the public consultations were taken into account in the planning of the project. Monitoring and evaluation actions will help to measure the level of satisfaction of these concerns with beneficiaries.

I. Justify the amount of funding requested, based on the full cost of the adaptation.

Baseline scenario

Under a baseline scenario the semi-arid woodland savanna region would continue to be dominated by slash and burn, rain-fed agriculture and extensive-method for livestock. East Guinea-Bissau is already highly food-insecure, and under increasing temperatures it is highly likely that availability (production) and access (prices, income) to food would be further affected, potentially increasing the need for international food aid programs such as through WFP/FAO. Changes in total precipitation and higher drought or flood frequency would act in a similar direction.

While there is high uncertainty regarding the precise regional or local consequences of global warming, inaction would surely be detrimental for East Guinea-Bissau, both in terms of incurred losses due to current climatic variability and future change. Current coping practices (see Part I) by farmers in times of climatic stresses are clearly inadequate.

On the potential sites identified during the preparation of the present Full Project, farmers exploit the lowlands with traditional techniques and remain exposed to the adverse effects of climate change, which is confirmed by irregular rainfall, floods and precipitous dryness which sometimes occur during periods of bloom. The frequency of these floods and the precocious dryness compromise the efforts of the peasants to overcome the food needs. Production remains low and food security is not assured. Poverty and malnutrition are the daily experiences of farmers.

To deal with the precarious food situation, households are appeal to a number of survival strategies for their food namely reduction in the quantities consumed by adults including youth

for the benefit of the children, (ii) less preferred food consumption; (iii) reduction of the amount of food eaten during the meal; (iv) the reduction in the number of meals per day; (v) selling household assets ; and (iii) dependent on the help of family or friend. These strategies not only to plunge people into a vicious circle where poverty and food insecurity are mutually reinforcing but show that there are real difficulties of access to food in Bissau Guinean rural and especially during the lean period.

In fact, reducing food consumption below nutritional requirements or selling household assets in order to survive in times of droughts directly reduces the vector of assets a family has to react to an additional year of poor weather; where reducing food intake and selling assets as coping strategy cannot be repeated each year. Poor households, especially those headed by women, are most exposed to shocks and seasonal variations in production, their vulnerability to future food insecurity increases.

In this context, socioeconomic scenarios point at increasing risks of poverty-related problems such as food insecurity, health or social welfare. Climate variability and change thus put heavy burdens on family farmers that will very likely exceed their coping capacities.

Alternative adaptation option

Faced with climate uncertainty and fragility of ecosystems that characterize Bissau Guinea, irrigation and crop yield improvement through the use of rainwater collection techniques appear to be the most important factors to throw the foundations for local and national economic and social development. The mobilization and control of water to meet the needs of irrigation and livestock become an imperative in order to improve food security and incomes of the population. The activities to fight against the flood and silting of parcels, the forest fire, to improve the soil fertility, livestock and domestic water supply, forage production, etc. will help to secure crops and livestock production, increase yields and incomes of the beneficiaries

The project's integrated approach integrates both concrete adaptations, as well as strengthening capacities across scales in adaptation planning and climate risk management. While the project represents only a first step in scaling-up successful actions and learning, its outcomes for the intervention region and country foresee a significantly positive alternative scenario compared to the baseline. In terms of the project interventions there are limited options available in terms of alternative actions to build climate resilience in the agriculture and water resources sectors. Additionality to a socioeconomic baseline scenario is hard to prove because of vulnerability's multi-faceted character (environmental, social, economic and institutional, among other).

The reinforcement of the technical and organizational capacities of the producers and the superimposition of the activities of adaptation on site are all actions that will contribute to the achievement of the results of the project, to reinforce the resilience of the populations to the harmful effects of the climatic changes, to improve yields and production and finally to reduce food insecurity, malnutrition and poverty..

J. Describe how the sustainability of results of the project / program has been taken into account in the design of the project / program.

The project sustainability is based on the strong involvement of national stakeholders (beneficiaries, ministries, civil society, private sector, etc.) at all stages of its design. Its

implementation involves the participation of community organizations, beneficiaries, NGOs and the private sector. Each actor will contribute to a participatory approach where all activities will be conducted in close consultation with the beneficiaries.

The sustainability of the project outcomes relates to “practice-focused” component #2 (climate-smart agriculture and water management) and "capacity-focused" components #1 and #4 (technical capacity and outreach). Capacity-building at ministerial level will provide permanent benefits after project completion: trained government personnel will see their position strengthened, and may engage in future national adaptation project development, or continue research issues related to climate change and adaptation. Because of the project's novel but realistic character for Guinea-Bissau and the region of West Africa, its results will likely influence practice and policy beyond project implementation time.

Outcome sustainability of component #2 may be more complicated: even though local interventions may function at project end in 202, a principal concern would be the abandonment of these subprojects after technical assistance and regular visits from the project team cease. Participative and integrative processes are key elements to avoid these developments. This includes taking into account needs of the communities, respecting different opinions, creating a project ownership for the participating tabancas etc. The project will also monitor and evaluate (M&E) project implementation continuously; therefore reducing the risk that families may be unsatisfied with the interventions. Preliminary lessons from the ongoing GEF/UNDP-00077229 project seem to indicate that the risk of subprojects terminating after project teams have left is relatively low and manageable.

The project seeks commitment from the regional water authority (Regional Directorate of Water Resources) and other relevant local authorities to maintain small water retention and other infrastructure after project end, in line with the institutional set-up of GEF/UNDP-00077229 project. Villagers are to take ownership of other small scale infrastructure, and young men and female will be trained by the project to undertake smaller maintenances, thus also contributing to local capacity building and empowerment. This commitment has been obtained during the project consultation phase, and will be a conditionality for any subproject implementation.

The irrigation infrastructures are built for 30 years life. The Project management unit will select by application a local NGO, who will organize the beneficiaries in committees and subcommittees around each of the activities. The NGO will support beneficiaries in the implementation of a fee mechanism to allow each irrigated perimeter and each unit of supply of drinking water (drilling and ramps) of sufficient financial resources for infrastructure maintenance and continuity of operations (acquisition of seeds, fertilizers, pesticides and small equipment of exploitation, etc.) in the short, medium and long terms.

The funds collected by the various subcommittees will be deposited on an account of a bank or a microfinance institution created on behalf of the beneficiaries of the site in question. At the level of each Management Committee, the cash will be preferably held by women known for their honesty and good management of public goods.

Not only the project releases a total profit of 5 554 420 USD annually, it is expected a financial participation of beneficiaries in the maintenance of infrastructure and the actions of fire brigades amounting to 457 284 USD per year. This will ensure optimal operation of the infrastructure, a development of the appointed areas and management of bushfires for 30 years. With the climate-smart technical capabilities acquired and substantial profits by the groups, they can invest in the expansion of areas for a greater production of rice and vegetable products. This will help to ensure food security at the national level.

The technical and organizational capacity building planned under the output 1.2.1 for the various management committees (Perimeters management committees with four subcommittees: the Seed subcommittee, the Plowing subcommittee, the Irrigation Infrastructure Management subcommittee, and the Fertilizers and pesticides subcommittee; (ii) the Management committees of the water works to supply water to population and livestock; and (iii) the Pasture Management Committee), by the NGO recruited will allow recruited these committees to effectively assume their mission after the end of the project.

Under the supervision of the PMU, the NGO will organize the perimeters committees and will strengthen their management capacities by working closely with all State departments, each in its own field, to follow up on the perimeter committees after closure of the project. This includes among others:

- the regional directorates of agriculture (DRA) for concerns related to the management of agricultural equipment and fertilizers;
- the National Institute of Agrarian Research (INPA) for concerns related to seeds;
- regional plant protection services for concerns related to the management of pesticides;
- regional directorates for issues related to livestock;
- etc.

In addition, these various departments or institutions of the State will ensure within the technical review committee of the sub-projects, the regional approval committee, the Steering committee that the beneficiaries have taken into account in the sub-projects, sustainable management of fertilizers, seeds, pesticides and small agricultural equipment, etc.

K. Provide an overview of the environmental and social impacts and risks identified as relevant to the project / program.

Environmental and social classification of the project

The Adaptation Fund presents a set of principles by which it enacts environmental and social safeguards applicable to the projects it finances.

The main activities of the project include: (i) socio-climatic vulnerability assessment for East Guinea-Bissau; (ii) assessment of technical capacity building needs of ministries and field operatives for adaptation planning; (iii) formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources; (iv) technical trainings on adaptative systems and organizational capacity building for identified target groups; (v) technical assistance and rural extension for subprojects; (vi) formulation/Update of contingency plans for climate-risk management; (vii) support for famers groups by the government technical experts for adaptation actions implementation; (viii) capacity building to prevent forest fires; (ix) Development of lowlands to maintain agricultural production in drought periods; (x) Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply; (xi) rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs (seeds, fertilizers, pesticides quality), machinery and tools; (xii) construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development; (xiii) development of knowledge management strategy; (xiv) creation and operating of the project website; (xv) development of manual and other materials on best practices and measures for climate-smart agriculture; and (xvi) dissemination of results to other regions of Guinea-Bissau and West Africa.

Capacity-building activities of technical services and producers groups will have positive impacts on the management of climate resilient farming practices and the environmental management of the project (see detail of positive impacts under the item II.B). However, though activities that aims to set up water mobilization infrastructures will reduce flooding, they will lead to the drying up of crop plots, loss of production and thus entail negative impacts that need to be analyzed.

The development of these infrastructures on the identified potential sites will neither cause the relocation of population nor affect any natural habitat. It will not involve irreversible effects on the biophysical and human environment. Under this project, water mobilization infrastructure is small size and includes retention dykes and bunds of up to 2 m in height, levee dykes, mini-water retention ponds which height does not exceed 2.5m, drills for the development of garden products and the supply of safe drinking water for the population and the livestock.

The environmental and social impact assessment of a such project is to examine the positive and negative effects that the project could have on the environment and populations, and recommend any measures needed to prevent, minimize, mitigate or compensate for adverse effects and improve environmental performance.

Because the sites of the intervention areas of the subproject are not completely retained, an environment and social management framework (ESMF) is prepared for the project according to the 15 ESP principles of the Adaptation Fund. The results of the assessment of the risks and impacts of the subproject according to the 15 principles of the Adaptation Fund will be used to update the Environmental and Social Management Framework Plan (ESMFP) of the ESMF. Thus, the ESMFP updated with the subprojects ESIA results will become the Environmental and social management plan (ESMP) of the project. The project ESMP will be applicable to all subprojects according to the each subproject's ESMP.

Although the project area is not recognized as an area of pest attack, the implementation of the project calls for preventive and curative pest management techniques and therefore an Integrated Pest and Pesticide Management Plan (PGIPP in French) is prepared and submitted with the present proposal. An approach of integrated pest management is presented on page 121-123. A summary of this PGIPP is presented in English in the ANNEX 15 and PGIPP report.

When the sites of the subprojects will be definitively retained, an Environmental and social impact assessment (ESIA) will be prepared for each subproject on the basis of the 15 ESP principles of the Adaptation Fund.

Table 16 : Impact and potential risk assessment

Checklist of environmental and social principles	No further assessment required for compliance	Potential impacts and risks – further assessment and management required for compliance
<i>Compliance with the Law</i>	No project component or activity contravenes any laws or regulations currently in force in Guinea-Bissau. The project complies with the country's legal framework for agriculture, water and environmental protection. For the Full Proposal an Environmental and Social Management Framework (ESMF) is prepared	Weak. The Environmental and Social Management Framework is prepared for the project. When the sites of the subprojects will be definitively retained, an Environmental and social impact assessment (ESIA) will be prepared for each subproject on the basis of the 15 ESP principles of the Adaptation Fund. The results of the assessment of the risks and impacts of the subproject according to the 15

		principles of the Adaptation Fund will be used to update the Environmental and Social Management Framework Plan (ESMFP) of the ESMF. Thus, the ESMFP updated with the subprojects ESIA results will become the Environmental and social management plan (ESMP) of the project. The project ESMP will be applicable to all subprojects according to the requirements of each site.
<i>Access and Equity</i>	The intervention logic of the project is to provide potential beneficiaries in the target region with fair and equitable access to project activities and equipment throughout both planning and implementation phases. All producer groups which request participation will have an equal opportunity to benefit from the adaptation activities proposed by the project. Eligibility criteria of the project will be clear and transparent, and defined together with all relevant stakeholders, including traditional authorities. For the project interventions it is planned to include (i) difficulty of access to water in the area; (ii) vulnerability in terms of biophysical and climate risks; and (iii) social vulnerability as selection criteria. Through these criteria the project will assure the participation of less empowered groups, including women, minorities and particularly vulnerable groups. The project's results-framework will measure developments related to 'access and equity for vulnerable groups' throughout the project duration.	Very weak. The project implementation will guarantee access and equity to sensitive groups (including gender, elderly).
<i>Marginalized and Vulnerable Groups</i>	The project focuses on marginalized and vulnerable groups (minority groups, women, extremely poor, elderly, children etc.) and aims to assist them to improve their agricultural practices and living conditions. As such the project is not expected to have any negative impact on these groups. The consultation phase has identified Fula, Mandinga and Dgancanca ethnicities in the project region. Both Fula and Mandinga are majority groups, and work as farmers and ranchers, whereas Dgancanca constitute a minority group working with rice farming. Each community has its own lands at their disposal; therefore the project activities can be carried out without problem in collaboration with each ethnicity. The project will work with the majority and minority groups.	Very weak. The Full Project Proposal follow and will relevant Adaptation Fund environmental Policy for the full project development . These include: (a) screening of communities; (b) social assessment of needs and conflicts; (c) free, prior, and informed consultation with the affected groups.

<i>Human Rights</i>	The project affirms the fundamental rights of people in the intervention areas, and thus does not affect their freedom. Furthermore, the project does not integrate any activities contrary to custom law or traditions. Participation in the project cycle will be participatory and voluntary	Very weak. In particular, the RCCF and village heads will be consulted to avoid any negative impacts on human rights.
<i>Gender Equity and Women's Empowerment</i>	The logical framework of the project foresees direct participation for women and women's associations so they can benefit directly from project. In particular, the project proposes to support women to develop sustainable income generating activities and improve thereby their living conditions, therefore also empowering them in the context of a largely traditional and male-dominated society. The project will also promote women's participation in the RCCF and other regional and local fora: first, it is planned that the two honorable members from traditional authorities involved in development issues in the project region (one from Gabú, one from Bafatá) from the Rural Climate Change Forum (RCCF) will be one female and one male. Second, the pre-selection committee (RPPSC) to be created for the selection of subproject activities will be composed of four important and respected traditional authorities of the RCCF (one male and one female from Gabú, one male and one female from Bafatá) in the project region. Participation of women and empowerment will also be a key focus of the project's M&E framework.	Very weak. In Guinea Bissau, the women are the most farmers cultivate rice and working in gardens field. So, they will be the largest beneficiaries of the project. Progress with regards to women's participation and equity will be measured through the project's M&E framework, so compliance is not a problem.
<i>Core Labour Rights</i>	Core labor rights concern gender aspects, respect for workers; maximum work hours; child labor; etc. The project will ensure that national working standards are respected on production sites. The project will also ensure that appropriate wages will be paid per assigned task, and that no child labor will be employed. Social security standards (e.g. access to first aid) will also be respected and enforced.	Very weak. Monitoring on core labor rights will be undertaken throughout the project.
<i>Indigenous Peoples</i>	The sites work during project preparation has not identified any indigenous communities in the project areas.	Very weak. In the areas visited, no indigenous people were reported
<i>Involuntary Resettlement</i>	The project will not be developed on any site requiring the resettlement of populations (gives criterion of choice of sites)	No expropriation, relocation of producers or disruption of the livelihood activities of the producers will be undertaken.
<i>Protection of Natural Habitats</i>	All project activities will be carried out on areas already under production by farmers, and the project will teach	Weak. The Environmental and social management plans (ESMP) of the subprojects and the Environmental and social management

	farmers practices to dispense traditional slash-and-burn agriculture practices, therefore reducing pressures on deforestation. Furthermore, the project will work with water-saving irrigation techniques to limit runoff and soil erosion in the project area. Nevertheless, the project may cause negative impacts on the biophysical environment, including natural habitats, if project activities are not monitored consequently. For this reason the ESMF (Full Proposal) is prepared and M&E framework will focus on assessing potential risks and impacts on natural habitats.	plan (ESMP) of the project will be prepared in order to mitigate potentially adverse risks and impacts on natural habitats.
<i>Conservation of Biological Diversity</i>	The project will adopt agricultural practices that increase biodiversity compared to the baseline scenario, including conservation agriculture and agroforestry. Furthermore, the project will not introduce any exotic or invasive species of crops in the intervention areas. The brachiaria and legumes that will be promoted in the production of fodder for livestock, are local plants which integration will cause no problem. However, as noted before, small-scale water retention and irrigation may impact biodiversity particularly when areas need to be cleared	Weak. The Environmental and social management framework (ESMF) demonstrated that the risks and impacts of mini- water retentions on biological diversity are weak. If any, the mitigation measures are planned according to the environmental and social policies of the Adaptation Fund, as well as relevant national environmental and social regulations.
<i>Climate Change</i>	Focus of the project is climate change adaptation through climate-smart agriculture, which from a climate perspective incorporates resilience (adaptation) and reduction or removal of greenhouse gases (GHG) (mitigation). All adaptation actions undertaken under the umbrella of this project will need to be assessed constantly in order to understand whether they contribute to building of resilience under increasingly variable climate. The final assessment of the project as well as the socio-climatic vulnerability assessment will support achieving this principle. Potential impacts on land use will also be registered, thus contributing to the assessment of GHG emissions reductions (mitigation).	Weak. Project foresees assessments on adaptation and mitigation.
<i>Pollution Prevention and Resource Efficiency</i>	Water resources are currently exposed to various forms of pollution associated with the use of fertilizers and pesticides and manure. The project will work to prevent these types of pollution. There may be further pollution linked to the construction of small water retention, including deterioration in water quality downstream, or detrimental effects	Weak. The ESMF demonstrated that the risks and impacts that the pollution of water and soil can be avoided. An Pest and Pesticides management plan is prepared. The deterioration of water quality is most often due to the fact that fertilizers and pesticides are not used in an efficient and timely manner. In order to prevent deterioration of the quality of the soil and especially of water, the project envisaged

	<p>through limiting access to water by downstream users.</p>	<p>activities to strengthen producers' capacities in the use of fertilizers and pesticides (output 1.2.1.). On-site technical support for the proper management of fertilizers and pesticides will be provided to producers by the technical services (output 1.2.4). In addition, periodic water analyzes are scheduled in order to monitor the evolution of water quality and prevent downstream and on-site water pollution. This action is foreseen under output 2.1.3 particularly the activity 2.1.3.7 and budgeted.</p> <p>The sites are victims of the phenomena of floods during the rainy period and limit the possibilities of development of cultures.</p> <p>In addition, the irregularity of rainfall causes a series of alternation of floods and dewatering of the parcels which the duration of each phase depends on the amounts of rain.</p> <p>These phenomena are intense because farmers don't have means to retain and regulate the flow of water at the watershed level.</p> <p>For the people of downstream, it is expected that each water infrastructure has an independent channel to regulate the flow of water at the downstream of the landscaped perimeters.</p> <p>Thus, water storage facilities are designed so that people of downstream can't anymore suffer floods phenomena and have regularly enough water for their development.</p> <p>Although the Eastern regions of Guinea Bissau experience severe drought, rainfall is recorded around 1250 mm to 1500 mm of water. However, more than 80% of precipitation is concentrated in July, August and September. From November to May there is no rain. This concentration of rainfall over only three to four months is the cause of the flooding of the sites limiting their development. The purpose of the project's infrastructure is to regulate the flow of water on the sites and ensure a regular downstream flow through a flow channel considered in the design of water mobilization infrastructure. Beyond the water that will be used for crops on the sites, a steady flow of water will be effective throughout the rainy season to ensure the water needs required downstream so as not to disrupt ecosystems and human life. At the end of the rainy season and on dates recognized for the beginning of the draining of the plots (sites) due to the lack of water, the downstream water channel will be closed. The same will be applied in case of potential downstream impacts. The decision to close the canal will be made on the basis of known water needs of populations and downstream ecosystems.</p>
--	--	---

		<p>The Regional Directorate for Agricultural Hydraulic Infrastructures will decide on the closure of the canal jointly with the PMU, perimeter manager, the Rural Climate Change Forum¹³ (RCCF) representative (the local president if possible) and the Environment vigilance Committees (ARC)¹⁴ representative (the local president if possible) of downstream villages. To facilitate the participation of downstream populations and beneficiaries in the decision to close the canal, the Minister of Agriculture and the Minister of the Environment will issue an interministerial decree in order to empower the stakeholders in the management of the water, upstream and downstream of the perimeters developed within the framework of the project. Lessons learned from this experience will be used for other projects in the country.</p> <p>This will ensure the availability of water in the catchment retention basin, complementary irrigation of crops that need water to mature and other uses of beneficiaries. In cases where it is proved that there is a downstream supply of water during the dry season, the opening of the downstream feeder canal will be sized in accordance with the natural need of the human, animals and ecosystems downstream.</p>
<i>Public Health</i>	Disease-burden may be linked to vector-borne diseases of small water retention. Otherwise, the project will promote organic fertilizer use and sustainable practices that may be beneficial to human health. By increasing food production and variety thereof the overall health of the population will be strengthened as calorie intake rises and nutritional quality of the food consumed is higher.	Weak. Mitigation actions are planned in the Environmental and social management framework plan (ESMFP) included in the ESMF in order to discern health impacts due to vector-borne disease occurrence, caused by small dam construction. The ESMFP will be updated with the subprojects ESIA results to become the Environmental and social management plan (ESMP) of the project. The project ESMP will be applicable to all subprojects according to the requirements of each subproject's ESMP.
<i>Physical and Cultural Heritage</i>	No adverse impacts on physical and cultural heritage of the people in the intervention areas were identified. A public consultation was conducted in the project areas. The chances of damage to physical assets are extremely low.	Weak. One of the criteria of selection of the intervention area is: "Not located in a known cultural heritage area or suspected to be sheltering a cultural heritage". This criterion enables to limit the risks related to the destruction of the cultural and physical heritage. However, incidental findings are not excluded on non-suspected sites. Thus, the risk of destruction of physical and cultural heritage during the incidental findings is present. Thus, in case of fortuitous discoveries of physical and cultural heritage on a subproject site, mitigation actions should be planned in the subproject ESMP.

¹³ Rural Climate Change Forum (RCCF) is composed of rural population representative of upstream and downstream villages

¹⁴ The RCCF and the ARC are committees that have been set up in villages to promote the sharing of information and experiences and exchanges related respectively to the climate change and the environment. These two committees are complementary actors and are made up of representatives of the local population.

<i>Lands and Soil Conservation</i>	The project will have positive impacts on the landscape of the intervention areas through the establishment of agro forestry systems and conservation agriculture. Soil conservation and restoring fertility is a key project activity.	Very weak. The project actions will improved the fertility of the soil and the sustainable management of the Lands.
------------------------------------	---	---

Project generic impact assessment

- Project impacts identification

The identification of impacts is based on the adapted Leopold matrix, which links the expected impact-oriented activities per phase and the environmental and social principles of the Adaptation Fund. The crossing of the two parameters makes it possible to identify the impact of the activity on the environmental component considered in the corresponding E&S principles of the Adaptation Fund.

In summary, taking into account the analysis made from the table below, the predictable impacts.

Interactions between activities sources of impact by phase of the project following the principles of the Adaptation Fund

		Principles of the Adaptation Fund														
Phases	Sources of impacts of the project components and activities	Compliance with the law	Access and equity	Vulnerable and marginalized groups	Human rights	Gender and women's empowerment	Working conditions	Indigenous peoples	Involuntary resettlement	Protection of natural habitats	Conservation of biological diversity	Climate change	Pollution prevention and management efficiency	Public health	Physical cultural heritage	Land and soil conservation
Preparation phase	Launch of the project															
	Activities to strengthen technical, organizational and institutional capacity		x	x		x										
	Realization of in-depth APD	x														
	Call for tenders and Acquisition of equipment			x												
Construction phase	Mobilization and transfer of equipment to sites													x		
	Installation and construction downturn	x			x		x			x	x					
	Implantation															
	Preparation and field stripping															
	Infrastructure construction				x		x			x	x	x				x
Operating phase	Soil preparation and plowing															
	Acquisition of improved seeds									x	x					
	Seedlings						x							x		
	Water exploitation												x			
	Operationalization of Structures						x				x				x	x
	Maintenance of works and cultures				x											
	Acquisition and application of fertilizers (organic manure or chemical fertilizer);		x	x	x	x	x			x	x		x	x		x
	Use of pesticides		x	x	x	x	x			x	x	x	x	x		x
	Rejection of the packaging of pesticides										x		x	x		x
	Harvest															
End of project	Income generating activity		x	x		x								x		
	Abandonment of equipment															
	Dismantling						x						x	x		

Two types of impact can be identified: positive impacts and negative impacts.

Positive impacts are described under item II. B

Description of the environmental and social negative impacts and risk

The table below describes the negative environmental and social risks and impacts of the project as a whole. These negative impacts and risks can arise in one or the other phase of the project, namely: project preparation, construction of infrastructures, operationalization of project sites, and completion of the project.

Triggered principles E & S of the FA	Impacts / risks identified	Description of the impact or the risk
Compliance with the law	Low integration of environmental and social issues relative to the Adaptation Fund ESP principles in the subprojects ESIA and ESMP	Given the current practice in ESIA's formulation in the country in accordance with national regulations and those of donors such as the World Bank and BOAD, it is possible that, the impacts and risks assessment are not sufficiently take into account the the environmental and social principles of the Adaptation Fund ESP in the formulation of the sub-project ESIA's.
	Low capacity to producers for the implementation of environmental and social measures, in accordance with national law and the principles of the Adaptation Fund	Environmental and social impact studies or records of environmental and social impact made on behalf of the subprojects will be accompanied by environmental and Social Management Plans according to the environmental and social principles of the Adaptation Fund. The prescribed measures will be implemented on plots by the producers. However, there is a risk to the low ability of producers to implement environmental and social measures proposed, in accordance with national law and the principles of the Adaptation Fund
<i>Access and equity</i>	Risk of increase in inequalities between women, men, children and particularly vulnerable groups	Producers are, in their majority, the poor who are often not integrated into the decision-making process. They are men, women and young people. There is therefore a risk of lack of access to the resources of the project by the producers at the level of the technical and organizational capacity-building, access to the facilities of modern irrigation techniques, access to farm inputs of quality and development of revenue-generating facilities.
	Risk of not full participation of certain groups in the preparation and the implementation of the subproject	There is a risk that all members of the beneficiary groups are not involved in the preparation and the implementation of subprojects
Marginalized and vulnerable groups	Risk of no involvement of marginalized and vulnerable groups	Under the project, it is proposed to strengthen the irrigation system to diversify agricultural production and reduce the vulnerability of farmers to the harmful consequences of climate change. With this

Triggered principles E & S of the FA	Impacts / risks identified	Description of the impact or the risk
	in the provision of the resources of the project	<p>approach, the project will ensure better adaptation to climate change that affects the production and productivity. The activities will contribute to create assets for long-term recipients. The activities of the project will also help create livelihoods and income for farmers.</p> <p>There may be the risk that these vulnerable and marginalized groups are not involved in the technical and organizational capacity-building provided under component 1, not have access to modern technical equipment of irrigation under component 2, or lack of agricultural inputs and quality of income-generating activities under component 3 of the project.</p>
Fundamental labour rights	Risk related to the health and safety of workers	<p>During construction works, and during their operation, workers are exposed to the risk of accident at work that can go from simple death injuries. It is similarly during preparation of the soils, plowing operations, maintenance, etc.</p> <p>The supply of agricultural inputs also presents risks of transit traffic accident. Some producers may be exposed to the risk of poisoning if they are not trained in the use of pesticides, and if they have no individual protection equipment.</p>
	Risk of child labour outside the limits of the law	In rural areas, children help parents in field activities. Under the project, it is not excluded that children are used to difficult tasks
Gender equality and empowerment of women	Insufficient taking into account of gender in the implementation of the project	Women and young people were consulted widely at the stage of identification and design of projects. It is important to be sure that they will be actually involved in the phase of implementation of the project which will be carried out by the project management unit which is not yet in place.
Protection of natural habitats	Destruction of vegetation and wildlife habitat	Development can cause the destruction of vegetation and Wildlife Habitat on the site
	Risk of d the quality of the water and soil egradation	<p>Strip of land and the use of fertilizer and pesticides can contribute to the degradation of soils</p> <p>The use of pesticides and chemical fertilizers can be sources of impairment of the quality of water and soil</p>
Pollution prevention and efficient management of resources	Contamination of soils and waters by pollutants	The development of the project will require the use of pesticides under the pest control. Using rational number of pesticides and chemical fertilizers on the plot may cause pollution of water and soil
	Risk of non-availability water for downstream populations	Construction of water infrastructure could limit the availability of water for the population downstream landscaped perimeters.
Public health	Risk of poisoning by inhalation or by consumption of	The implementation of the project has risks to human health through the use of pesticides and other chemicals on the plots. Exposure to pesticides can

Triggered principles E & S of the FA	Impacts / risks identified	Description of the impact or the risk
	water or food contaminated by pesticides or fertilizers	be direct (contact) when applying, passing over a treaty site or secondary or indirect (for water, food...) and is likely to affect the entire population in this case.
	Development of water-related diseases	The continued presence of the irrigated water could cause the development of waterborne diseases (malaria, typhoid fever, amoebic dysentery, etc.).
Physical and cultural heritage	Risk of destruction of the physical heritage during incidental findings	Although the identification of sites takes into account the protection of the physical cultural heritage, incidental findings are not excluded during the implementation of the project. Is the risk of destruction of the physical and cultural heritage during incidental findings
Land and soil conservation	Deterioration in the quality of the soil and the Earth	Although the subproject includes reforestation activities and seeks to promote agroforestry, some activities can have a negative impact on the quality of the soil including the use of pesticides and chemical fertilizers. Rational use of fertilizers and pesticides use will lead to pollute and degrade the soil. Chemical residue may form with other natural compound in the soil and degrade the complex soil pH and cause acidification.

The impact/risk and mitigation measures are contained in table 24, under Item C of PART III.

PART III: IMPLEMENTATION MODALITIES

A. Describe the implementation modalities of the project/program.

PROJECT IMPLEMENTATION ARRANGEMENT

The General Direction of Environment (GDE) of the Ministry of Environment and Sustainable Development of Guinea-Bissau (MESD) will be the executing entity and BOAD will be the implementing entity for this project.

The project management committees/bodies are: (i) Project Steering Committee, (ii) Project Management Unit, (iii) Technical Committee for subproject proposals review; (iv) Subproject Approval Committee, (v) Perimeters (developed sites) Management Committees, (vi) Drinking water infrastructure for population and livestock management Committee, and (vii) Pasture management Committee.

- Project Steering Committee

Created by Ministerial order of the Ministry of Environment and Sustainable Development, the Steering Committee is responsible for the strategic direction and supervision of the implementation of the project. It approves Annual work plans budgeted (AWPB) and meets twice a year. It is chaired by the General Secretary of the Ministry of Environment and Sustainable Development and includes all stakeholders taking into account the key actors. A national technical planning workshop will be organized once a year, prior to the first session of the steering Committee. This workshop will bring together all actors involved in the technical implementation of the project. The procedures manual will specify the relevant structures. The Steering Committee of Project will serve as a space for debate on themes concerning the Project and interdepartmental coordination of project activities. It will review and approve the Manual of procedures, schedules, progress and audit reports of the project. This board is to be composed of:

- (i) representatives from relevant ministries and public organisms, including: Ministry of Environment and Sustainable Development, Ministry of Agriculture, forest and livestock, General Direction of Water Resources, Ministry of women, family and social solidarity, Ministry of Economy, Planning and Regional Integration, National Institute of Agrarian Research (INPA), National Research Institute (INEP), National Meteorology Institute (INM-GB);
- (ii) representatives from civil society: three (03) representatives of Rural Climate Change Forum (RCCF), with one traditional authority and two (02) women from Gabù and Bafatà ; two (02) representatives of NGO's association/platform (one from Gabù and one from Bafatà) ; two (02) representative of women Groups (one from Gabù and one from Bafatà).

- Project Management Unit

GDE/MESD will put in place a project management unit (PMU) whose role will be to (i) ensure the overall project management and monitoring, in accordance with Adaptation Fund rules; (ii) facilitate communication and networking among key stakeholders in Bissau; (iii) organize the meetings of the Project Steering Committee (PSC); and (iv) support local stakeholders to realize the project's objective; (v) ensure that all relevant stakeholders are adequately informed of the grievance mechanism; (vi) managed compliant under the control of the IE.

The proposed structure of the PMU consists of a Program Manager which will also function as National Project Coordination (NPC) and the support staff. The role of the NPC is to oversee the implementation of the project, including administrative and technical coordination and reporting back of progress upon feed-back received from the project partners, BOAD, Adaptation Fund and MESD.

The PMU will consist of one National Coordinator (NC) one dedicated field coordinator, an agronomist expert based in Gabù (FCG) and one Assistant dedicated field coordinator, an adaptation Expert based in Bafatà (FCB), one [Specialist in policy and regulatory development and capacity building in climate change and environment](#), one Communication Expert. The PMU staff will include: an accountant (Specialist procurement), a secretary, three drivers, two housekeepers (Gabù and Bafatà), and two guardians (Gabù and Bafatà). The National Project Coordination function will be supported by streamlined secretarial, logistic and administrative support in Bissau, Gabú and Bafatá.

The FCG and the FCB, in complementary collaboration, will lead the technical implementation process of Components 2. The technical implementation of the project Component 1 will be led by a [Specialist in policy and regulatory development and capacity building in climate change and environment under the responsibility of the](#) National Coordinator. The technical implementation of the project Component 3 will be led by a Communication Expert [under the responsibility of the](#) National Coordinator. The National Coordinator will be specifically in charge of component 4 relative to the project management.

The NC, the [Specialist in policy and regulatory development and capacity building in climate change and environment](#), the FCG, the FCB, the Communication Expert, the proximity support facilitators/animators and the other experts shall be recruited through a selective process. Selection and contracting will follow relevant national legislation and/or BOAD/Adaptation Fund requirements.

The project will be implemented in collaboration with the relevant Ministries as Ministry of Environment and Sustainable Development, the Ministry of Agriculture, forest and livestock, the General Direction of Water Resources, the [Ministry of women, family and social solidarity](#), research institutions on seed production, water use and quality with the support from local communities, private sector associations, NGOs and other representative civil society, technical organisms, regional governments, rural extensionists, and other regional/local partners.

The technical implementation in the field will be supported by local associations, NGOs, women's associations, respected elders and traditional chiefs, particularly through the channels of the existing Rural Climate Change Forum (RCCF) in the Project Region. The RCCF will discuss and evaluate with the villagers and agriculture groups project activities, send in suggestions for improvement, and provide close ties with the tabancas. Through the RCCFs, Sanitary Vigilance Committees further safeguards for forest preservation and climate change sensibilization will also be implemented. With the support of the Ministry of Environment and Sustainable Development, the Ministry of Agriculture, forest and livestock, the General Direction of Water Resources, the [Ministry of women, family and social solidarity](#), the RCCF will assure that the Project's activities continue after end of the official project.

[Apart from the team forming the PMU, the project will use the services of building companies and external consultants such as: a hydraulic engineer, Pastoralist, agro-sylvo-pastoral system, etc.](#)

- Technical Committee for subproject proposals review

As part of the implementation of the project, a technical committee will be set up to review the subprojects proposals. It will consist of: (i) one expert of agriculture; (ii) one expert of hydraulic management; (iii) one expert of livestock; (iv) one expert of the Competent Environmental Assessment Authority (AAAC); (v) one expert of forest management; (vi) one expert of pest and pesticide management; (vii) two representatives of PMU. This committee will be responsible for the subprojects proposals technical analysis according to the selection criteria set up by the PMU.

- Regional Approval committees

The regional approval committee is represented by the Regional Planning Office put in place by the national texts to ensure the regional development planification. According to the national development texts, each micro-project must go through the Regional Planning Office before being submitted for funding. The project will be executed in two regions. There will therefore two regional approval committees: (i) Gabù region sub-project Approval Committee; and (ii) Bafatà region sub-projects Approval Committee.

The Regional Planning Office is the consultative body for the intervention of the different actors in the development process of the regions. Its functions include: (i) identify, formulate, implement and monitor the projects; (ii) monitor the development and implementation of micro-projects in the region; (iii) provide assistance to villages with the development activities; etc.

The regional Governor is the President of the committee. The Regional Director of Planning and Statistics is its Executive Secretary. The Regional Administrative Secretary of the governorate is the Secretary of the committee. Apart of these members, each Regional Planning Office is composed, inter alia, of:

- representatives of the Regional Directorates for: Agriculture, Natural Resources (Environment), Poverty alleviation, Finance, Health, Justice, Meteorology, Public Works, Education, Guard -budgetary, etc .;
- a representative of national and foreign NGOs;
- a representative of the Institute of Women and Children;
- a representative of the media;
- a representative of civil society;
- a representative of the religious entities;
- a representative of the traditional society.

See annex 14, the competencies and composition of the Regional Planning Office.

- Perimeters management committees

In the practice in Guinea Bissau, the management committee is set up in the developed perimeters for rice production. In the framework of the LDCF project, the organization of the perimeters committees is ongoing.

On each site of the Adaptation Fund project, a Management Committee of the perimeter will be set up. This Committee will be to ensure good management and the functioning of the entire perimeter. It will ensure good planning of agricultural campaign, the implementation of devices to support better agricultural production. Under the management of the perimeter, one will distinguish four subcommittees: (i) the Seed subcommittee, (ii) the Plowing subcommittee, (iii) the Irrigation Infrastructure Management subcommittee, and (iv) the Fertilizers and pesticides subcommittee. The role of its subcommittee is described below. Each perimeter management Committee will be composed of thirteen (13) members consisting of: (i) a Chairman of the

Committee elected from among the beneficiaries; and (ii) three (03) representatives of each Subcommittee (president, Treasurer and Secretary of the Subcommittee). The Committee will meet once a month to reflect on the conduct of the agricultural campaign, problems and approaches to solutions. The representatives of each Subcommittee will point to the members of the Committee and will be responsible for disseminating the decisions taken at the level of the Committee of management of the perimeter. Each Subcommittee will be made up of nine (09) members including five (05) women and four (04) men.

The roles of subcommittees are:

➤ *The Subcommittee of seeds*

Availability in time of the resistant and profitable varieties is important to the success of the crop year. The Subcommittee of the seeds will be responsible for monitoring seed multiplication in order to ensure sufficient seed availability for the entire perimeter. This Subcommittee will work in collaboration with the General Directorate of agriculture and the national Institute of agronomic research (INPA) for the acquisition of quality seeds. This Subcommittee will participate and will follow the training on the multiplication of seeds scheduled in component 1 of the project.

➤ *The Subcommittee of ploughing*

The preparation of the soil is an important step for any culture. Sit a good seedling or a repiquetage to allow a rigorous development of the plant and a good production is necessary. Labour Committee will be responsible to track all activities relating to the preparation of the soil (cleaning, pre-irrigation, ploughing, milling). He will be responsible for the planning of labour in a sense of respect for the cultural calendar. This Committee will be responsible for maintaining plowing equipment in good working condition.

➤ *The Sub-Committee on management of irrigation infrastructure*

Irrigation and maintenance of irrigation infrastructure is essential for the carrying out of an agricultural season. The Irrigation Infrastructure Management Subcommittee will be responsible for ensuring the proper functioning of water retention, irrigation and perimeter protection structures.

➤ *The Subcommittee of the fertilizers and pesticides*

With regard to fertilizers and pesticides, the subcommittee that will be responsible for them will ensure their timely availability and distribution according to well-defined criteria in collaboration with the PMU. The committees will also be responsible for interacting with the Regional Directorates of Agriculture to ensure the availability of good fertilizers and pesticides and their proper use during each crop year. This sub-committee will work with the different institutions involved in the project integrated pest and pesticides management (refer to the Approach to Pests and pesticides management described below).

- **Management committees of the hydraulics infrastructures to supply water to population and livestock**

To ensure the management and maintenance of the infrastructure of water supply for the population and livestock (water borehole and ramps), a water management Committee will be set up in each beneficiary village.

The role of the committee will be to ensure: (i) the proper use and proper functioning of the water supply infrastructure; (ii) equitable access to drinking water for all segments of the

population; (iii) collection of fees, the amount of which will be withheld by agreement with the PMU, the NGO, the representatives of the Regional Directorate of the rural water supply, representatives of the Governorate of Bafatà and Gabù; (iv) repair of infrastructure in the event of a technical breakdown.

The committee will consist of 5 members including 3 women and 2 men. On the basis of the known experiences and intrinsic values of the candidates who have presented themselves, the members of the water management committee will be elected publicly by the beneficiary population. The committee will consist of:

- A president ;
- Secretary ;
- A Treasurer;
- A person in charge of the control of the condition of the works and the follow-up of the repair;
- One responsible for the purchase of repair parts.

Royalty collectors could be elected by neighborhood, by village, by grouping as appropriate. The committee will open a savings account at a micro-finance office in the place where the royalties collected from the population will be paid. The committee will report monthly to the beneficiary groups and populations under the supervision of the village chief (s) concerned.

The organization of the committee will be supervised by an NGO that will be recruited by the PMU through a call for candidates to support the organization of beneficiaries. The NGO will have to provide efficient support that will allow the committee to be able to act autonomously at the close of the project. The interventions of the NGO for the good functioning of the committee and the works will be done with the concrete involvement of the representatives of the Regional Directorate of the rural water supply, the representatives of the Governorate of Bafatà and Gabù under the supervision of the PMU.

- Pasture Management Committee

In each administrative sector¹⁵ where a forage production activity will be developed, a pasture management committee will be set up.

The role of this committee will be to ensure: (i) the availability and distribution of brachiaria seeds for the development of pasture fields, and (ii) supervise the development of pasture fields. The committee will work with the National Institute of Agrarian Research to acquire quality seeds. It will work collaboratively with other committees including the Perimeter Management Committee for Joint Water Resources Management. It will also collaborate with forest resources management services to limit and better manage grazing fires.

The committee will be composed of 5 members formed by:

- A president
- A secretary
- A Treasurer
- One responsible for the availability and distribution of brachiaria seeds
- One responsible for the development of the pasture fields.

These members will be elected from breeding groups.

The committee will meet on a monthly basis to review the activities undertaken, identify weaknesses in the conduct of activities and propose measures for improvement. The work of

¹⁵ In Guinea Bissau, the regions are subdivided into several administrative sectors.

the committee will be supervised by the PMU through the recruited NGO. The Committee will also benefit from the technical support of the regional livestock services.

Approach to integrated pests and pesticides management in the implementation of the project

Integrated Pest Management (IPM) is concerned with a holistic approach towards pest control techniques, aiming to keep pesticide applications and other interventions within economically justified levels while minimizing any risks (real or potential) to human health or the environment. Natural pest control plays a significant role in IPM, and includes direct and indirect measures (see table below). The present project on Climate-smart agriculture aims to significantly reduce chemical pesticide application already indirectly, where many activities –use of crops adapted to local conditions, reliance on appropriate yield expectations, use of resistant varieties, optimal densification of cultivars, etc. – overlap with indirect plant protection¹⁶.

The project area is not recognized as an area of pest attack. However, the implementation of the project calls for preventive and curative pest management techniques and therefore the preparation of an Integrated Pest and Pesticide Management Plan (PGIPP in French). The development of the PGIPP is based on information gathered in the project area, through consultations with beneficiaries, technical services for plant protection, agriculture, environment, livestock, Public health, etc. Field information was complemented by documentary research and analysis on pest and pesticide management.

The option for the promotion of integrated pest and pesticide management in the framework of the project is made to **avoid or** considerably reduce the use of chemical pesticides. In case of parasite attack, the least hazardous methods will be preferred. Chemical pesticides will be used in extreme cases where less dangerous methods will prove ineffective. In this case, the choice of use of chemical pesticides will be made in accordance with the recommendations of the integrated pest and pesticide management plan. **Given that Guinea Bissau does not have sustained experience in integrated pests and pesticides management, it is very important to take into account, the experiences and lessons learned of the FAO in the pests and pesticides integrated management in the Africa's subsaharian countries. It is why, the members of National committee of pest and pesticides management (CNGP), the DPV officers, the PMU, the NGO's representatives in charge of the supervision of beneficiaries on the perimeters will be trained on the integrated management of the pests and pesticides in the project area by an Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries. This expert will be recruited by the PMU under the supervision of the Implementing Entity (activity planned under output 1.2.1, item d.).**

At the end of the training sessions, a box of integrated pests and pesticides management tools will be made available to the beneficiaries, the DPV, the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions. These tools box prepared by the Expert with the FAO experiences in the integrated pests and pesticides management, will indicate the appropriate actions to take on the various pests and pesticides. The tools box will also indicate the limited WHO class U and III pesticides that the beneficiaries can use if the agronomic, cultural, mechanical and biological methods prove to be ineffective in dealing with the problem.

The following approach will ensure coordinated and sustainable management of pests and pesticides in the project framework.

¹⁶ See Climate-Smart Agriculture Sourcebook: FAO, 2013

Step 1: Dissemination of pest management alternatives

The alternatives to pesticides as agronomic, cultural, mechanical and biological control will be disseminated for better use by the producers. The resistant seed will be promoted also. This actions will be integrated early the sites or crop development to prevent the attack by pests. The box of integrated pests and pesticides management tools elaborated following the training by IPM Expert will be made available to the beneficiaries.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building on integrated pest and pesticides management.

Step 2 : When an attack of crops by pests is observed on a site, the beneficiaries will use, under the control of the site facilitator and the project regional coordinator, the appropriate alternatives retained in the IPM tools prepared with the support of the IPM Expert on which the beneficiaries, the facilitators and the project regional coordinators have already received training. These alternatives measures will be applied in a spirit of environmental protection and human health. The project regional coordinator will inform the PMU on the adequate actions taken on the perimeter by the beneficiaries to end the attack of pests.

Step 3 : In extreme cases, where alternatives actions will prove ineffective, the regional directorate of DPV, who have also received training from the IPM Expert, will advise the PMU on the need for limited class III or U pesticides purchases. The use of the WHO class III and U pesticides by the beneficiaries will be done with the support of PMU under the control of the DPV. The National Pesticide Management Committee¹⁷ (CNGP) will be informed by the DPV and the PMU will inform the BOAD on the process.

The possible alternatives for chemical pest control which can be used in the framework of the project are presented in the table below :

¹⁷ To overcome the problems associated with the uncontrolled use of pesticides and to reduce the risks associated with the use of poor quality pesticides, a National Pesticide Management Committee (CNGP) is set up in Guinea Bissau, Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations, customs. The CNGP ensures, inter alia: (i) the implementation and monitoring of compliance with pesticide quality control procedures and standards; (ii) post-registration control of pesticides; (lii) compliance monitoring of pesticides; Control of the distribution and use of pesticides; (iv) control of Maximum Residue Limits (MRLs) of imported products for local consumption; (v) control of professionals in the pesticide industry; (vi) Maintaining the register of operators in the sector; (vii) the maintenance and updating of registered pesticides; (viii) denunciation of unauthorized pesticides entering the country; (ix) monitoring of toxicovigilance; (x) monitoring of pre-extension trials; (ix) monitoring the implementation of international pesticide conventions.

Indirect plant protection	Monitoring and forecasting	Direct plant protection
<p>Optimal use of natural resources:</p> <ul style="list-style-type: none"> • Use crop adapted to local conditions • Rely on appropriate yield expectations • Use of resistant varieties • Weed management with adequate intensity of competition • Adequate mixtures of varieties and crops • Optimal timing of sowing period • Training on pest and appropriate pesticides, particularly biological options, and importance of ecological compensation areas <p>Use of farming practices without negative impact on the agro-ecosystems:</p> <ul style="list-style-type: none"> • No use of surplus input of nutrients (especially N); • Optimal density of crop and foliage to facilitate ventilation • Low intensity of tillage/cultivation and production methods protecting soil fertility • Weed management for erosion control • Biodiversity conservation and protection to enhance biodiversity, therefore reducing pest incidence • Where adequate protection and augmentation of beneficial biological antagonists. 	<ul style="list-style-type: none"> • Monitoring and forecasting of pest incidence will be done in accordance with the project's IPM plan. • No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building on integrated pest and pesticides management. 	<p>Use of selective pest control methods:</p> <ul style="list-style-type: none"> • Wherever and whenever adequate, reliance on biological control, biopesticides, etc. <p>Chemical pest control methods, only where other options are failing or will be very likely:</p> <ul style="list-style-type: none"> • Preference for the most specific and selective pesticides (class III and U of WHO) • Preference for least harmful and least toxic pesticides (class III and U of WHO)

SUBPROJECT IMPLEMENTATION APPROACH

The project that will be implemented in the northern parts of the regions of Gabù and Bafatà namely the sectors of Sonaco, Pirada, Pitche, Gabù, Cuntoboel and Ganadu, aims to address key vulnerabilities in agriculture and water resources management, and thus contribute to immediate and longer-term development and resilience needs of extremely vulnerable farmers, with a focus on extremely vulnerable groups: women, youth, elderly and children. For this purpose, the following three main components have been considered: (i) Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning; (ii) Enhance the resilience of existing agricultural productive systems, including water control; and (iii) Knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning. This project will be implemented through sub-projects which will be subject to a selection process.

Within the framework of the project implementation, two types of activities can be distinguished: 1) one that will be chosen by the communities for the development of the subprojects, and 2) one that have already been decided in the proposal and which will not be decided by the communities.

The type 1 activities which will be chosen by the communities for the development of the subprojects:

These activities concern:

- construction of dams and development of downstream lowlands;
- development of lowlands without dams;
- construction of drills/wells to improve livestock and domestic water supply;
- development of market gardens with drills construction;
- support for forage production for livestock.

All these activities are described under component 2 namely outputs: 2.1.1; 2.1.2; 2.1.3; and output 2.1.4.

The type 2 activities which have already been decided in the proposal

It concerns:

- all activities under component 1 (Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning);
- all activities under component 3 (Knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning);
- some activities of component 2 :
 - support to access improved, resistant and short cycle seeds;
 - support to groups for acquisition of quality fertilizers, quality pesticide;
 - support for the acquisition of equipment/facilities of production and development of products for demonstration.

Although potential sites have been identified during project formulation, a call for the sub-projects proposal will be launched to allow farmers to express their interest in the project. Each subproject can be designed on the basis of the type 1 activities by the applicants (target

groups) and submitted to the governor of the Region.

The following lines were defined to guide the sub-project selection process.

Step 1: Information on the Project approach and call for subproject proposal

A large public consultation is conducted during the project preparation. This stage is to be completed within the first 6 months after the establishment of the Project Management Unit. The information on investment opportunities among target populations, the intervention strategy of the subproject, the process of formulation of applications by promoters (farmers groups), the technical review and the validation process will be disseminated at this step. This, to enable the promoters of subproject express their interest to the project. After that, there will be a call for project proposal.

The criteria for selection of the sub-project will be prepared by the Project management unit (PMU), and made available to subprojects promoters, regional technical review committee to select the best subprojects and the regional approval committee to approve the best-subproject. One of the criteria will be the willingness of sub-project promoters to put in place an infrastructure maintenance device in the short and long term.

Step 2: Selection of the potential beneficiaries by the technical review committee

At this step, the expression of interest will be formulated by the applicants. The requests formulated by several villages and/or several farmers groups should be encouraged by the PMU. The requests will be sent to the Governor of the region.

As mentioned above, in addition to the potential sites that have been identified, any other site that can be assigned to type 1 activities can be considered in the selection of subprojects. In order to select the best sites and the most interesting potential beneficiaries, a call for expressions of interest will be launched. Farmers' and breeders' groups, villages and groups of villages will address their request to the governor. NGOs working in the two regions will be recruited on the basis of a call for applications to prepare an expression of interest for each applicant.

Expressions of interest registered by the Regional Governorate will be forwarded by the Governor to the Sub-Projects Technical Review Committee for the pre-selection of beneficiaries. The composition of the Technical Review Committee is described below. The Technical Review Committee, on the basis of the following criteria, will select the sites for which the subprojects may be prepared:

- the applicant's level of vulnerability to the variability of climate change;
- the real needs of the applicant;
- the adequacy of the site in relation to demand;
- the level of organization of the applicant;
- the level of interest of women and young people in the applicant's organization;
- the applicant's experience in the activity for which he/she would like to position himself;
- the commitment of the applicant to comply with the technical, financial, environmental and social rules of the project;
- availability of suitable land for perimeters;
- availability of groundwater for drinking water infrastructure and gardens;
- the number of operators to judge the per capita investment of beneficiaries;
- the contribution of the beneficiaries to the work;
- etc.

These criteria may be strengthened by the Project Management Unit (PMU) depending on the progress observed in the field.

Technical Review Committee will selected the good subprojects on the basis of the financial, economic, environmental, social and gender criterion.

The technical review committee will ensure the inclusion of marginalized populations, women, and youth peoples. In this sense, the criteria for selection of the sub-project will take into account vulnerable and marginalized groups and gender mainstreaming. In the definition of the selection criteria, the project management unit will ensure that at least 50% of the direct beneficiaries of the project are women.

Step 3: Subprojects environmental and social due diligence

As a reminder, the project will be implemented in the regions of Gabù and Bafatà. Because, the sites to be developed are not yet definitively retained, an Environmental and Social Management Framework (ESMF) is prepared for the project with an Environmental and Social Management Framework Plan (ESMFP).

When the choice of the sub-project sites are finalized, environmental and social impact assessments of the subprojects will be conducted in accordance with the Adaptation Fund's ESP by consultants recruited by the PMU under the supervision of the Implementing Entity.

An ESIA with ESMP will be prepared for each subproject according to the 15 principles of the Adaptation Fund. Thus, the ESMFP of the project will be updated with the subprojects ESIA and ESMP to become the Environmental and social management plan (ESMP) of the project. The project ESMP will be applicable to all subprojects according to the requirements of the ESMP of each subproject.

To enable the integration of the environmental and social dimensions in the design and implementation of the sub-projects to be financed by the Adaptation Fund project, it is essential to propose a procedure allowing the assessment of the environmental and social impacts, the implementation of the environmental and social measures and the actors who will be responsible for their implementation. Indeed, the procedure will be the approach which will allow to determine the level and modalities of consideration of the environmental and social impacts in the cycle of the subprojects. The studies that will be conducted will be guided by the environmental and social principles of the Adaptation Fund.

The step 3.1, 3.2, 3.3 below should not take more than 4 months after after the establishment of the PMU.

Step 3.1- Formulation of the Terms of reference of the sub projects and authorization of the AAAC for the realization of the ESIA

For subprojects selected that require the formulation of an environmental and social impact assessment, the Terms of reference (TORs) will be prepared by the PMU following the result of the screening and subject to the approval of the BOAD. The TOR will be submitted to the BOAD with a short list of consultants to prepare the ESIA. The BOAD will send to the PMU, the non objection for the TORs and the short list for the recruitment of the Consultant. Once the non objection is issued by BOAD for the PMU, a "project notice" ("avis de projet" according to the national ESIA procedures) annexed to the TORs and the consultants selected by the PMU, will be sent by the PMU to the AAAC. The AAAC will confirm the categorization of the sub project and will issue the authorization to conduct the environmental assessment, in

accordance with the national procedures of ESIA. The authorization receipted from the AAAC by the PMU will allow the consultant to prepare the ESIA report.

Step 3.2- Preparation of the Environmental and social impact assessment for the subprojects

The consultant recruited by the PMU will lead the ESIA of the subprojects with an environmental and social management Plan (ESMP) in accordance with the environmental and social Policy of the Adaptation Fund. Mitigation, compensation and prevention measures will be determined according to the level of impacts and risks identified in the field taking into account all of the 15 environmental and social principles of the Adaptation Fund. The ESMP will take into account the integrated pest and pesticides management measures.

The ESIA of the subprojects with their ESMP will be used to update the current Environmental and Social Management Framework Plan (ESMFP) and to have definitively the project environmental and social management plan (ESMP) that is applicable to all Subprojects according to the requirements of each subproject ESMP. One of the Consultants who have conducted the sub-projects ESIA will be selected to put on the ESMP of the project under the supervision of the PMU and the control of the BOAD.

Step 3.3- Review and approval of the sub-projects ESIA and the project ESMP

When the subprojects ESIA reports will be prepared, they will be disclosed at the level of the PMU, the AAAC and BOAD to allow the stakeholders to make their comments on the ESIA content. The comments will be integrated to correct the reports by the consultant.

The reports corrected by the consultant will be submitted to the PMU.

Under the supervision of the AAAC, the ESIA reports produced by the Consultant will be submitted to an ESIA Report approval Committee in accordance with the national procedures of ESIA. The ESIA Report Approval Committee members will be appointed by order of the Minister in Charge of the environment in accordance with the national procedures of ESIA. The Minister of the environment will issue the authorizations on the approvals reports of the Committee and on the recommendations of the AAAC in accordance with the national procedures of ESIA.

To save time and money, the PMU will ensure that the review and approval of the ESIA of the all subprojects by the ESIA report approval Committee may take place together if possible.

Once an ESIA receive the authorization of the Minister in charge of environment, the PMU will register it subproject in its financing portfolio. The BOAD will disclose the summary of the ESIA and the ESMP of subproject on its website.

Step 3.4- Execution of environmental and social measures

The promoter is responsible for the implementation of environmental and social measures in all phases of the subproject. It will be supported, if necessary, by a Consultant and the Site animators in case it would have no in-house expertise for this purpose and that the planned training by the PMU in the context of the project will be insufficient to help him.

Step 3.5- Environmental and social management plan supervision

Environmental and social management plan supervision is the responsibility of the PMU with the support of national and local technical institutions concerned.

The supervision is done at the level of all the sub-projects in accordance with the ESMP of the project. A monthly report will be prepared by the PMU on the management of the ESMP and sent to the BOAD.

Step 3.7. Subprojects grievance management

The BOAD shall disclose its grievance mechanism in Guinea Bissau and specifically in Gabù and Bafatà regions, to provide people which could be affected by the subproject with an accessible, transparent, fair and effective process for receiving and addressing their complaints about environmental or social harms caused by any such subproject.

Complaints regarding the subprojects will be sent to the PMU, to the Resident mission of the BOAD in Guinea Bissau, to the BOAD headquarter or to the Adaptation Fund Board secretariat. The addresses will be in the grievance mechanism which will be disclosed.

The BOAD, through the PMU, is responsible to compile all the complaints, to respond promptly to all such complaints and identify who must correct the shortcomings and may be sure that the shortcomings are corrected in the appropriate time. BOAD must take all arrangements to control the correction of the shortcomings on the field at the subprojects level and have the report from the PMU on the satisfaction of the complainants.

Step 3.7-: Environmental and social monitoring

(See section III.D, page 163).

Step 4: The approval of the subprojects

The Reports of technical review of the subprojects (step 3.3), including the results of the steps 3.1 and 3.2, with the authorization of the Minister in charge of the environment, will be submitted by the PMU to the regional Committee for approval. The regional Committee will proceed to the approval of the subprojects. The PMU will send the sub project proposal and the ESIA of the subproject to the BOAD for non objection.

Step 5: Sub-project funding

The approval of a sub-project and the non-objection of the BOAD entitle the beneficiaries of the sub-projects to receive the financing. The PMU can therefore sign a financing contract with the beneficiaries and the sub-project is financed on the basis of the budget for each activity.

Step 6: Implementation of subprojects

The subprojects will be implemented as described in the PART III. A.

The implementation of environmental and social measures, supervision and environmental and social monitoring will be conducted as described under the step 3.4 to 3.7 and the item: PART III.C and PART III.D.

Step 7: Launching process, by the PMU, of tender documents of business

This process involves the preparation of Tender Documents and their launching. Given the specificity of equipment, acquisitions and ordering of the installation, work will be done by the PMU in the name and on behalf of farmers. During this stage, the PMU will select, in accordance with the regulations in force in Bissau Guinea, Adaptation Fund and BOAD

procedures, companies for the acquisition of equipment, development work and accompanying infrastructure.

IMPLEMENTING ENTITY (BOAD) SPECIALIZED TECHNICAL SERVICES

The implementing entity (BOAD) will give general management support and specialized technical support services to the project. The indicative services provided by the implementation entity (BOAD) are summarized in the table below.

Table 17: indicative technical services of the implementation entity

Step	Indicatives services
Identification, Sourcing and Screening of ideas	<ul style="list-style-type: none"> - Provide information on substantive issues in adaptation associated with the purpose of the Adaptation Fund (AF). - Engage in upstream policy dialogue related to a potential application to the AF. - Verify soundness and potential eligibility of identified idea for AF.
Feasibility Assessment / Due Diligence Review	<ul style="list-style-type: none"> - Provide up-front guidance on converting general idea into a feasible project; - Source technical expertise in line with the scope of the project; - Verify technical reports and project conceptualization; - Provide detailed screening against technical, financial social and risk criteria and provide statement of likely eligibility against AF requirements; - Determination of execution modality and local capacity assessment of the national executing entity; - Assist in identifying technical partners; - Validate partner technical abilities; - Obtain clearances from AF.
Development & Preparation of project	<ul style="list-style-type: none"> - Provide technical support, backstopping and troubleshooting to convert the idea into a technically feasible and operationally viable project; - Source technical expertise in line with the scope of the Project needs; - Verify technical reports and project conceptualization; - Verify technical soundness, quality of preparation, and match with AF expectations; - Negotiate and obtain clearances by AF; - Respond to information requests, arrange revisions; - etc.
Selection of the sub-project	<ul style="list-style-type: none"> - Make the subproject screening; - Control the preparation of the TOR of subproject environmental and social assessment; - Make no-objection on the TOR; - Supervizes the selection of consultants to prepare subproject ESIA; - Analyzes the ESIA report and provide the comments to be taking into account by the consultants; - Supervizes the subproject approval.
Implementation of the project	<ul style="list-style-type: none"> - Technical support in preparing TORs and verifying expertise for technical positions; - oversee the process of recruiting consultant (FAO expert) for the training on integrated pests and pesticides management ; - Oversee all training activities and the application of best practice measures in the field ; - Manages the grievance process and ensures that the complainants have been satisfied with the resolution of their complaint ; - Provide technical and operational guidance project teams;

Step	Indicatives services
	<ul style="list-style-type: none"> - Verification of technical validity / match with AF expectations of inception report; - Provide technical information as needed to facilitate implementation of the project activities; - Provide advisory services as required; - Provide technical support, participation as necessary during project activities; - Provide troubleshooting support if needed; - Provide support and oversight missions as necessary; - Receipt, allocation and reporting to the AF of financial resources; - Allocate and monitor Annual Spending Limits based on agreed work plans; - Oversight and monitoring of AF funds; - Return unspent funds to AF.
Project monitoring and reporting	<ul style="list-style-type: none"> - Provide technical support in preparing TOR and verify expertise for technical positions involving in the and reporting; - Provide technical monitoring, progress monitoring, validation and quality assurance; - Conduct field monitoring missions; - Verify the implementation of adaptive actions; - Monitor the implementation of the agreement of compliant resolution; - Receives and analyzes the monthly report on the subproject ESIA implementation; - Verify the concrete implementation of the ESMP including integrated pest and pesticides management and recommend specific corrective actions to ensure that the subprojects complies with the E & S principles of the Adaptation Fund; - Submit annually, the reports on the implementation of ESMP to the Adaptation Fund; - Include in the midterm and final evaluation report of the project, the status of implementation of the environmental and social management plan including integrated pest and pesticides management and the implementation of the grievance mechanism
Project evaluation and reporting	<ul style="list-style-type: none"> - Provide technical support in preparing TOR and verify expertise for technical positions involving evaluation and reporting; - Conduct the evaluation field missions on the different aspects of the project, namely: technical, environmental, social, pest and pesticides management, Grievance management, budget, etc.; - Participate in briefing / debriefing; - Verify technical validity / match with AF expectations of all evaluation and other reports; - Undertake technical analysis, validate results, and compile lessons; - Disseminate technical findings.

STAKEHOLDERS AND THEIR ROLES

The table below shows the roles of various entities by project component

Table 18: Roles of key stakeholders

Products	Public institutions and technical services of Environment, Agriculture, Livestock, Water, Forestry, Civil protection, National Laborator...)	Local organizations (umbrella, cooperatives ...)	Private technical support structures	Project Management Unit	Implementation entity
Component 1: Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning				Coordinate support among stakeholders, manage funds; ensure the proper conduct of procurements of goods and services markets, develop activity reports,	The implementing entity (BOAD) will give general management support and specialized technical support services to the project. The indicative services provided by the
Outcome 1.1. Technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions enhanced					
1.1.1 Socio-climatic vulnerability assessment for East Guinea-Bissau	Participate in the organization		Provide expertise for the capacity building of the local development services agents of Ministry of Agriculture on climate change and its impacts on food security		
1.1.2 Assessment of technical capacity building needs of ministries and field operatives for adaptation planning	Participate in the organization of training for its own staff		Provide the necessary expertise for the training of technical staff on		

			natural resource monitoring tools	<p>Ensure effective monitoring and evaluation of project activities. Coordinate support among stakeholders, manage funds; ensure the proper conduct of procurements of goods and services markets, develop activity reports, Ensure effective monitoring and evaluation of project activities Etc.</p>	<p>implementation entity (BOAD) are relative to: (i) Identification, Sourcing and Screening of Ideas; (ii) Feasibility Assessment / Due Diligence Review; (iii) Development & Preparation of sub-project; (iv) Implementation of the project; (v) Grievance mechanism implementation; (vi) Evaluation and Reporting.</p>
1.1.3 Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources	Participate to the training		Provide the necessary expertise for the capacity enhancing		
Outcome 1.2 Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, environmental, social and gender in practice (on-site) and adaptation planning					
1.2.1 Technical trainings on adaptative systems and organizational capacity building for ONGS and identified target groups	Provide support for sensitization and training of target beneficiaries	Provide support for the mobilization and sensitization of communities	Provide the necessary expertise		
1.2.2 Technical assistance and rural extension for subprojects	Provide technical support	Mobilize and organize the famers			
1.2.3 Formulation/Update of contingency plans for climate-risk management	Provide support for training of farmers	Mobilize and organize the famers	Provide the necessary expertise for the developpement of the		
1.2.4 Support for famers groups by the government technical experts for adaptation actions implementation	Provide technical support	Mobilize and organize the famers	Provide the necessary assistance, if need		
1.2.5 Capacity building to prevent forest fires	Provide technical support				
Component 2: Enhance the resilience of existing agricultural productive systems, including water control					
Outcome 2.1 Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security					
2.1.1 Development of lowlands to maintain agricultural production in drought periods	Provide support for identification of the sites	Mobilization of the population especially local workforce	Provide necessary expertise for the study and the		

			construction of small-scale irrigation system	
2.1.2 Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply	Provide support for identification of the sites	Mobilization of the population especially local workforce	Provide necessary expertise for the study and the construction of mini-water retention for irrigation	
2.1.3 Rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs, machinery and tools	Provide sensibilisation and technical support			
2.1.4 Construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development	Provide support for identification of the sites	Mobilization of the population especially local workforce	Provide expertise necessary	
Componet 3: Knowledge management of lessons learned on climate-smart agriculture and adaptation planning				
Outcome 3.1 Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries				
Output 3.1.1. Knowledge management strategy developed	Provide technical support to develop the knowledge management strategy		Provide expertise if necessary	
Output 3.1.2. Development and animation of the project website	Making available data, lessons learned and other information on the project for publication on the project website.	Provide support to the collection and processing of data on the project	Provide support to the collection and processing of data on the project, if necessary	
				Coordinate support among stakeholders, manage funds; ensure the proper conduct of procurements of goods and services markets, develop activity reports, Ensure effective monitoring and

Output 3.1.3. Manual and other materials on best practices and measures for climate-smart agriculture are developed	Provide necessary expertise	Provide support for the dissemination of information within communities on the best adaptation practices	Provide exper	evaluation of project activities Etc.
Output 3.1.4. Dissemination of results to other regions of Guinea-Bissau and West Africa	Organization of exchange meetings in other regions	Mobilization of the population	Animation of the exchange meeting	

B. *Describe the financial risks' management measures and risks of project /program.*

The following table summarizes the key project risks.

Table 19: Project risk

Category of risk	Risks	Description
Political	Government political instability and frequent political post shifts high in government may hinder the project implementation	During this quinquennium, Guinea-Bissau experienced several governments with changes of posts and attributions of ministries due to instability prevails. Changes are continuing and may result in changes to the responsibilities of departments, management and technical services. This can undermine the implementation of the project if this climate of instability persists. empowerment and advocacy at the highest ministerial levels on climate change may be lost due to ministerial changes. The impact at the effective project roll-out levels is much less, but lack of ministerial support will mean that progress is slowed in terms of policy and action change.
	Political resistance/inertia to adjust 'governance frameworks' (i.e. policies, plans, strategies, programmes etc.).	Often when a policy, plan or strategy is prepared and validated it is generally considered 'final'. There is reluctance to treat it as a dynamic document, which may be subject to adjustments. This applies in particular to the plans and strategies which are time bound and the programmes that involve external funding. There may be inertia over any policy change additionally, in under-resourced, low capacity government departments
	Policymakers or politicians prioritize economic benefits over social and environmental needs	Politicians can want that some project activities such as the fight against forest fires, capacities building, contribute to the development of the economic activities of the country.

Category of risk	Risks	Description
Strategical	Reluctance to apply the knowledge and practices for adaptation to climate change Cultural barriers in accepting new techniques can be expected	<p>Cultural practices in Guinea-Bissau are important. In many families and communities there are complex reasons for existing practices, and new techniques may be unpopular because they require a fundamental change to customs and practices, even if they do increase yields, income and/or livelihoods security. In addition, it is frequently easier, and outcomes are more predictable, to keep with existing livelihood strategies, even if these are not as successful as they might be. If new farming techniques and livelihood opportunities are tailored to the local reality – or, better still- existing techniques only slightly changed and improved, with demonstrated success and strong elements of community-level partnership and NGO support, technique uptake will be increased and more rapid. The project needs to monitor this carefully with in depth social household surveys on practices and behavioural change.</p> <p>Fortunately, the results of the LDCF project convinced Gabu and Bafata populations which are strongly looking for the project of the Adaptation Fund</p>
Institutional	Overlap of interventions of public institutions	The project covers various aspects including environmental, agriculture, livestock, water, forests, etc. These aspects are the attributions of several departments/ministries. If the responsibilities are not clearly defined, there is a risk of overlap of interventions of the departments.
	Weak participation and involvement of public services at regional level	It may happen that local public technical services that are supposed to provide support to producers in the conduct of agricultural activities are loosely involved. This risk can exist with constantly positions changes.
	Lack of support from local administrative authorities (Gouvernors of region, Administrators of sectors, etc.)	If the local administrative authorities are not involved at the stage of identification and planning of the project, they will not give their support in the implementation of the project.
Technical	The low capacity of stakeholders to implement the project activities	The project envisages promoting resilient to climate change activities that were not practiced by the producers. They won't have capabilities necessary to implement these activities. Which may adversely affect the expected results of the project.
	The technical practices promoted by the project are confined to the first beneficiaries	There is risk that promoted practices are confined only to the intervention area of the project if the dissemination of practices through the replication of the project is not planned.
Financial	Bad financial governance and corrupt practices may lead to	Guinea Bissau is the 158 least corrupt nation out of 175 countries, according to the 2015 Corruption Perceptions

Category of risk	Risks	Description
	less funds invested in desired outcomes than planned	Index reported by Transparency International ¹⁸ . Where transparency and accountability mechanisms are weak or lacking, public financial management and development outcomes suffer as a result ¹⁸ .
Climatic	New facets of climate risks emerge during the life of the project	The flooding, the drought and climate disturbances could be increased during the life of the project.
Environmental ¹⁹	Exclusive focus on climate change may distract from wider environmental and poverty issues	Dealing with the risks of climate change may lead to less focus on other corollary environmental issues that are perhaps more important in the short term, such as loss of biodiversity.
	Weak integration of environmental issues and gender in the implementation of the project by the producers	Producers could unsufficiently observe environmental and social measures prescribed under the project by mistakes from lack of knowledge of their interest.
Management	Failiure in coordination of the project	The study on the lessons learned of the LDCF project noted some shortcomings in the cordination of the project. If arrangements are not made, this risk can occur in the context of the present project.
	Failiure in communication of the project	The project covers several villages with different dialects. If an effective program of communication is not established, this mission can be reveal a failure under the project implementation.
	Failiure in monitoring of activities due to conflict of interest between stakeholders	Several institutions will be involved in the monitoring of the activities of the project. If the role of each actors isn't defined through clear memorandum between the project and technical institutions, a conflict of interest may arise in the monitoring of the project.
	Lack of infrastructure monitoring that would be degraded or abandoned as soon as the project is completed	If the selected beneficiaries do not sufficiently involved in the project, infrastructure established can be dropped or will degrade quickly just after the close of the project.

The risks identified above were evaluated according to their probability of occurrence. Evaluation indicators are presented in the table below.

¹⁸ www.tradingeconomics.com/guinea-bissau/corruption-rank

¹⁹ Other environmental and social risks are taken into account under item K, PART II and Item C, PART III.

Table 20: Risk indicators

		Impact				
		CRITICAL	HIGH	MEDIUM	LOW	NEGLIGIBLE
Likelihood	CERTAIN / IMMINENT	Critical	Critical	High	Medium	Low
	VERY LIKELY	Critical	High	High	Medium	Low
	LIKELY	High	High	Medium	Low	Negligible
	MODERATELY LIKELY	Medium	Medium	Low	Low	Negligible
	UNLIKELY	Low	Low	Negligible	Negligible	Considered to pose no determinable risk

These indicators are used to assess and characterize the different risks of the project to provide mitigation measures (see table below).

Table 21: Project Risks Assessment and Mitigation Measures

Category	Risks	Impact	likelihood	Risks assessment	Mitigation measures
Political	Government political instability and frequent political post shifts high in government may hinder the project implementation	High	Moderately likely	Medium	Although this risk is outside the jurisdiction of the project, it is deemed a low risk based on experiences made in other projects during times of political instability. In the past, the Government of Guinea-Bissau has shown strong commitment to carry out projects even under political instability. Strong support for the policy changes in key ministries will be generated at the Directorate General level, which have been relatively stable in staffing despite political changes.
	Political resistance/inertia to adjust 'governance frameworks' (i.e. policies, plans, strategies, programmes etc.).	Medium	Likely	Medium	In the framework of the project, an policy expert will be contracted to draft and implement the policies, procedures and guidelines. It is recommended that this expert have already a good level and relations in the national administration. The strong interaction with the national institutions and local stakeholders and their institutions will help to avoid this risk.
	Policymakers or politicians prioritize economic benefits over social and environmental needs	Medium	Moderately likely	Low	Project activities explicitly integrate social, environmental and economic development needs in an integrative framework of climate-resilient agriculture. The project will prioritize low-regrets strategies for resiliency that have proven impact also on farmer income.
Strategic	Reluctance to apply the knowledge and practices for adaptation to climate change Cultural barriers in accepting new techniques can be expected.	Medium	Moderately likely	Low	Strong interaction with local stakeholders and their institutions (e.g. RCCF) with regard to project activities is to reduce reluctance further. Awareness raising and training programs will be developed by the project under team under coordination of the PMU.

Category	Risks	Impact	likelihood	Risks assessment	Mitigation measures
					<p>During the preparation of the project, beneficiaries have been widely consulted and have expressed their strong support for the project. The project provided outreach to beneficiaries. An information, exchanges and communication plan for a full participation of stakeholders will be established in the first year of the project.</p> <p>The project will work in collaboration with community organizations, local NGOs already on the ground in a strategic partnership framework. This will allow to overcome cultural barriers. The communication and awareness strategy of the project will consider this. A strategic plan for knowledge dissemination will be formulated and the communication will be made in local languages.</p>
Institutional	Overlap of interventions of public institutions	Medium	Moderately likely	Low	Clear memorandum of intervention between the project and the different institutions involved in project implementation will take care of this.
	Weak participation and involvement of public services at regional level	Medium	Moderately likely	Low	The RCCF meetings will take place every 3 months. These meetings will include government and civil society members.
	Lack of support from local administrative authorities (Governors of region, Administrators of sectors, etc.)	Medium	Moderately likely	Low	<p>Local administrative authorities are involved in the project design phase through meetings and during public consultation workshop in each region and sectors in project area.</p> <p>The Full Project, the ESMF and other documents of the project was validated through workshops with the effective presence of the Governor of Gabu, the representative of the Governor of Bafatá, all Administrators of sectors or their representatives.</p>

Category	Risks	Impact	likelihood	Risks assessment	Mitigation measures
Technical	The low capacity of stakeholders to implement the project activities	Medium	likely	Medium	The activities of capacity building of stakeholders under the component 1 will help to overcome this obstacle
	The technical practices promoted by the project are confined to the first beneficiaries	Low	Moderately likely	Low	The project plans a strong component 3 on dissemination of lessons learned. For more impact of climate-smart activities, it is recommended the replication of the project in the other regions of the country.
Financial	Bad financial governance and corrupt practices may lead to less funds invested in desired outcomes than planned	Medium	likely	Medium	Strong relationships with the overseeing government department MESD and financial oversight by BOAD with frequent, regular monitoring visits and audits will keep projects on line in terms of delivery and expenditure. Financial management procedures will be established and the coordination of the project will be trained on fiduciary standards.
Climatic	New facets of climate risks emerge during the life of the project	Medium	likely	Medium	The project will work with systems for crisis prevention coordinated by the government, the meteorology services, INPA and the climate change local and national committees. The project will train the different actors (mentoring technical services and farmers) to better understand and follow the predictions of climate changes to prevent / anticipate crises.
Environmental ²⁰	Exclusive focus on climate change may distract from wider environmental and poverty issues	Medium	Unlikely	Negligible	The project is designed alongside existing poverty reduction and environmental strategies in order to complement existing measures. An integrated

²⁰ Other environmental and social risks are taken into account under Item C, PART III.

Category	Risks	Impact	likelihood	Risks assessment	Mitigation measures
					<p>approach to agriculture, livestock, water and forest is designed to minimise this issue.</p> <p>The project as planned will help to reduce food insecurity and poverty of the beneficiaries.</p>
	Low integration of environmental and gender issues in the implementation of the project by the producers	Medium	likely	Medium	<p>On the base of the Environment and social safeguards and gender policies of BOAD and Adaptation Fund, an environmental and social management framework (ESMF) is prepared for a better integration of environmental and social issues within the project. The ESMF will be translated into specific Environmental and Social Management Plans for each intervention site. Periodic monitoring will be conducted by the competent services to ensure the effective implementation of the measures.</p> <p>Training and awareness activities are programmed to allow sufficient taking into account of environmental, social and gender issues in the implementation of activities on the sites.</p>
Operational/Management	Failure in coordination of the project	Medium	Likely	Medium	<p>One of the first activities after the establishment of the PMU is the development of a manual of procedures of the project to strengthen the management capacities of the PMU team.</p> <p>Establish a project consultative platform for sharing information and know-how among stakeholders, and promote frequent in person meetings. At national level inter-ministerial meetings will be held</p>
	Failure in project communication	Medium	likely	Medium	<p>An effective communication program is established taking into account the lessons learned from the LDCF project. The capacities of the communication coordination team will be strengthened.</p>

Category	Risks	Impact	likelihood	Risks assessment	Mitigation measures
					<p>Communications expert will be supported by local community organizations and local radio in advocacy.</p> <p>The manuals of good practices will be designed in a box of tool. The local languages will be used according to the village, for a greater ownership of the shares.</p>
	Failure in monitoring of activities due to conflict of interest between stakeholders	Medium	Moderately likely	Low	Des memorandum liant le projet et les autres acteurs impliqués dans le suivi devront être clairement établis. Memorandum between the project and other actors involved in the monitoring will be clearly established.
	Lack of infrastructure monitoring that would be degraded or abandoned as soon as the project is completed	Medium	likely	Medium	Monitoring of the achievements of the project will be integrated in the program of activities and budgets of the related Directorates in the fourth year of the project.

A continuous risk assessment system will be implemented. Risks will be presented annually in the PIR (Program Implementation Report) through a risk assessment matrix, including possible (alternative) mitigation actions. In tri-semester reports risk evaluation matrix will be incorporated, according to type (political, strategic, institutional, financial, operational, environmental, climatic), level (low, medium, critical), type of response (emergency actions, change in plans, other) and evolution of risks (stable, declining, increasing, etc.), and date of risk; also using the annual project report to give a more complete picture on risks and their development

- C. Describe the management measures of environmental and social risks, in line with the environmental and social policy of the Adaptation Fund.

The following table describes the management of risks and impacts of the project in accordance with the Environmental and Social Principles of the Adaptation Fund.

The environmental and social mitigation and enhancement measures are integrated in the project components and activities and budgeted.

Table 22: Environmental and social impact/risks of project and mitigation measures

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
Preparation phase									
Compliance with the Law		Low integration of environmental and social issues relative to the Adaptation Fund ESP principles in the subprojects ESIA and ESMP	Realization of an environmental and social impact assessment of the subprojects by taking into account the 15 principles of the environmental and social policy of the adaptation fund	Number of sites for which Environmental and social impact assessment document has been prepared according to the 15 principles of the Adaptation Funds ESP	BOAD	During the formulation of the subprojects ESIA	AAAC ²¹	General Directorate of Environment (GDE)	Take into account in outputs 2.1.1. and 2.1.2.
Access and equity		Risk of non-access of project resources by one group of the population	Put in place transparent criteria to permanently retain the sites to be developed and the beneficiaries	Level of application of fair criteria for the selection of participants in training sessions organized	PMU	During the final selection of sites	AAAC	GDE	PM
				Effectiveness of the project communication system	PMU				
				Consider women, the elderly and young people in the final selection of beneficiary groups	PMU				
Vulnerable and marginalized groups		Risk of non-profitability of vulnerable and marginalized groups to the effects of the project	Taking vulnerable and marginalized groups into account in the implementation	Percentage of young people and women beneficiaries of the project	PMU	Semi annual	AAAC	GDE	PM

²¹ Competent Environmental Assessment Authority

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
Gender Equality and the Empowerment of Women		Risk of non-integration of gender (men, women, young people, the elderly) in the implementation of the project	Taking gender into account in establishing beneficiary selection criteria	Number of women and young people receiving technical and financial support for the development of irrigated areas	PMU	Semi annual	AAAC	GDE	PM
Climate change	Increased capacity of stakeholders for the development and implementation of resilient approaches to Climate Change		Ensure the effective and efficient participation of women and youth in the various capacity building workshops through project facilitation activities	Number of women and young people able to assimilate the best approaches and practices taught and to pass on the knowledge gained to the other members of the group	PMU	Before the start of the fields activities	AAAC	GDE	PM
Construction phase									
Compliance with the Law		Risk of poor implementation of environmental and social clauses by companies	Integrate the environmental and social clauses of the BDs into the work execution contracts	Level of implementation of environmental and social measures by enterprises	PMU	During infrastructures construction	AAAC	GDE	5 000
			Conduct monitoring missions for indicators	Number of E & S monitoring missions and follow-up report	PMU	During infrastructures construction	AAAC	DGE	
Fundamental labor rights	Job creation		Promoting the use of local labor in the construction of structures	Proportion of local labor used in installation work	PMU	During construction	AAAC	GDE	PM

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
		Risk of injury to workers' health and safety	Require that each company awarded an infrastructure contract prepares and effectively implements an internal operating plan	Number of work accidents due to non-compliance with recommended measures	PMU	During construction	AAAC	DSP	PM
			Require appropriate protective equipment to personal and ensure effective wear	Proportion of workers wearing personal protective equipment	PMU	During construction	AAAC	GDE Public health directorate (PHD)	
	Risk of child labor outside the limits set by the Law	Sensitize enterprises on the disadvantages associated with the employment of children in difficult and risky tasks, including their health and development	Proportion of workers sensitized. Number of reported cases of employment of children in difficult tasks.	PMU	During construction	AAAC	DGE Work Directorate (WD)		
		Inform enterprises on the Labor Code	Number of campaigns organized. Proportion of workers informed and observing the provisions of the Labor Code	PMU	During construction	AAAC	GDE		
		Conduct monitoring of indicators	Number of monitoring mission conducted	PMU	During construction	AAAC	DGE Work Directorate (WD)	5 000	
Vulnerable and marginalized groups. Gender equality and empower	Improved access to water for irrigation by all		Dimension the water mobilization infrastructures to cover all the plots	Coverage rate of the irrigation network Number of complaints	PMU	During the construction of the structures	AAAC	GDE Generale Directorate of Agriculture (GDA) General Directorate of	PM

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
ment of women								Water (GDW)	
Pollution Prevention and Efficient Resource Management		Risk of non-availability of water for downstream populations	Construction of channel to regulate the flow of water at the downstream of the landscaped perimeters	Presence of a channel to ensure the flow of water downstream	PMU	During the construction of infrastructures	AAAC	GDE Generale Directorate of Agriculture (GDA) General Directorate of Water (GDW)	PM
Operation phase									
Compliance with the Law		Producers' low capacity to implement environmental and social measures in accordance with national legislation and the principles of the Adaptation Fund	Organize periodic sensitization campaigns on the national provisions and the E&S principles of the AF	Number of sensitization campaigns organized for producers	PMU	At the start of project implementation	AAAC	GDE	Take into account in the output 1.2.4
			Ensure the effective implementation of the measures proposed by the environmental and social management plans	Level of implementation of proposed mitigation measures on site	PMU	During the implementation of the project	AAAC	GDE	
			Conduct periodic monitoring missions	Number of E & S monitoring missions and report	PMU	During the implementation of the project (Once a year)	AAAC	GDE General Directorate of Agriculture (GDA)	10 000

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
Human rights		Risks of uncontrolled treatment and unequal treatment of cases of poisoning	Strengthen the intervention capacities of the health centers of the sectors of intervention for an effective and equitable treatment of the cases of poisoning	Level of improvement of the capacity of the health center of the municipality for an efficient and equitable treatment of the cases. Number of complaints cases	PMU	At the beginning of the project	AAAC	Directorate of plants protection (DPVV) DSP ²²	10 000
Fundamental labor rights	Relieving child labor and saving time due the availability of domestic water supply		Avoid the use of children during the week of classes Ensuring effective schooling for children	School development of the children of the members of the group. Number of complaints related to the employment of children during the week.	PMU	During operation	AAAC	DPE ²³ GDE	PM
		Risk to health and safety of workers	Raise awareness of workplace hazards	Number of outreach meetings Proportion of sensitized producers Number of workplace accidents related to non-compliance	PMU	During the first two years	AAAC	DSP DiP ²⁴	PM
			Require producers to wear appropriate protective equipments	Proportion of producers wearing appropriate protective equipment	PMU	During the implementation of the project	AAAC	GDE GDA	PM
	Designate one or two heads of hygiene-health-environment by production site	Presence of one or two agents whose responsibility is to ensure hygiene, health and environment on each site	PMU	At the start of operations	AAAC	GDA DSP GDE			

²² Directorate of Public Health
Child Protection Division

²⁴ Directorate of Labor

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
			Strengthen producers' capacity to use pesticides	Proportion of producers trained and practicing recommended measures for pesticide management	PMU	Annually	AAAC	DPV	PM
			Conduct missions of indicators monitoring	Number of missions conducted	PMU	During the implementation of the project	AAC	GDE GDA	5 000
		Risk of child labor outside the limits set by the Law	Sensitize farmers on the disadvantages associated with the employment of children in difficult and risky tasks, including their health and development	Proportion of producers of the sensitized group. Number of reported cases of employment of children in difficult tasks.	PMU	Annually	AAAC	GDA	PM
			Inform farmers on the Labor Code	Number of campaigns organized. Proportion of producers informed and observing the provisions of the Labor Code	PMU	At the start of operations	AAAC	GDE GDA	
Access and equity Vulnerable and marginalized groups Gender equality and empowerment of women	Improving women's incomes and development		Encourage the effective and efficient participation of women, young people and the elderly in project activities	Degree of involvement of women Proportion of women who have seen improvements in their living conditions	PMU	During operation	AAAC	GDE GDA	PM
	Improved access to quality inputs by all		Ensure equitable support for the acquisition of quality agricultural inputs	Number of cases of complaints related to the acquisition of agricultural inputs	PMU	During installation	AAAC	GDA	PM
Protection of		Destruction of vegetation and wildlife habitat	Promote the system of agroforestry and planting	Level of integration of the agroforestry system in agricultural practices.	PMU	Bi-annually	AAAC	DGF	PM

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
natural habitats			trees with nutritional or medicinal value	Reforested area with nutritional and medicinal trees.					
Conservation of biological diversity	Landscape improvement		The sites will be protected against silting with local species and if possible, with endangered species	Types of species used for agroforestry purposes	PMU	During operation	AAAC	DPV	PM
Pollution Prevention and Efficient Resource Management	Sustainable management of water resources		Design structures for the rational management of water and their maintenance	Level of performance of structures in terms of water conservation	PMU	During construction and during operation	AAAC	GDA	Take into account in the output 1.2.1 and 1.2.4 And 10 000 for monitoring
		Contamination of Soils and Water by Pollutants	Capacity-building sessions for actors involved in the pest and pesticides management (Regional Directorate of Plant Protection, National committee on pest and pesticides management, Regional Directorate for Environment and Sustainable Development, regional directorate for agriculture water infrastructures, responsible for the PMU, Regional Directorate for Agriculture, representative of the Governorate of the Region, Competent Authority for Environmental Assessment, Regional Directorate for Public Health, National Laboratory	Number of officers trained on non-chemical and coordinated and sustainable pest and pesticide management techniques	PMU	During operation	AAAC	DPV GDE GDA	

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
			for Agrarian Research (INPA), Members of Perimeters' Management Committee, NGO's representatives in charge of the supervision of the beneficiaries on sites, the PMU and the committee's members of the perimeters						
			Preparation, dissemination and use of the tools box of integrated pests and pesticides management with the support of the FAO Expert	Tools designed and appropriate use of the tools box by the stakeholders of the project	PMU	During the project implementation	AAAC	DPV CNGP GDE GDA	
			Promotion of the integrated pest and pesticides management methods	Penetration rate of integrated pest management	PMU	During operation	AAAC	DPV GDE GDA	
			Strengthen the capacity of the producers on the pesticide and fertilizers management system	Number of sessions organized to build the capacity of the producers on fertilizers and pesticides management	PMU	During the implementation of the project	AAAC	DPV	
			Support to the obsolete pesticides and packaging management	Number of pesticide management and monitoring by plant protection officers	PMU	During the implementation of the project	AAAC	DPV	
				Level of rational management of obsolete pesticides and packages on construction sites	PMU	During operation	AAAC	DPV	

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
				Quantity of obsolete pesticides and contaminated packaging destroyed	PMU	During operation	AAAC	DPV	
			Support for acquisition of the soil and water analysis equipment	Quality of water and soil quality analysis equipment	PMU	Before operation phase	AAAC	National Laboratory	70 000
			Analysis and monitoring of soil and water quality	Number of water and soil quality analysis conducted	PMU	During operation	AAAC	National Laboratory	24 000
		Risk of non-availability of water for downstream populations	Ensure periodic maintenance of the water flow channel for downstream proper operation	Frequency of water flow channel maintenance Operating of the water flow channel Number of complaints from downstream populations	PMU	During infrastructure exploitation	AAAC	GDA GDE	PM
Public health		Risk of poisoning by inhalation or by consumption of water or food contaminated with pesticides or fertilizers	Strengthening producers' capacity to manage pesticides in accordance with pesticides using standards	Number of training sessions on the rational use of pesticides	PMU	At the start of operations	AAAC	DPV	Take into account in the output 1.2.4 And 10 000 for monitoring
				Number of producers educated about the use of pesticides	PMU	During operation	AAAC	DPV	
			Strengthening the capacities of public health officials for the treatment of possible cases pesticide poisoning	Number of public health agents trained for the treatment of cases of pesticide poisoning	PMU	During operation	AAAC	DSP ²⁵ DPV	
				Percentage of beneficiaries to wear appropriate protective	PMU	During operation	AAAC	DPV	

²⁵ Directorate of public health

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
			Rational management of pesticides by farmers and individual protection	equipment when applying pesticides					
				Percentage of beneficiaries implementing good pesticide storage and use practices	PMU	During operation	AAAC	DPV	
			Number of cases of pesticide poisoning	PMU	During operation	AAAC	DPV		
			Establish a collection system for empty pesticide and obsolete packaging	Proportion of contaminated packaging collected (compare to quantities used) and transported for destruction	PMU/Producers	During operation	AAAC	DPV	
			Sensitize producers on hygiene measures during and after operations	Level of application of hygiene measures at the project site	PMU	During operation	AAAC	DPV	
Public health		Risk of development of waterborne diseases	Informing and sensitizing farmers on diseases related to the presence of water	Number of awareness sessions for health services in the project area to enable them to take into account all new cases of waterborne diseases	PMU	During operation	AAAC	MS	Take into account under outputs 1.2.4 and 2.1.5
				Evolution of the number of cases of water-borne diseases (malaria, bilharziasis, diarrhea, schistosomiasis, etc.)					
	Improving the nutritional status of children and supporting Food Safety		The crop varieties with nutritional value to support food security and improve child nutrition are promoted in the project	Evolution of the nutritional status of children in municipalities of intervention	PMU	During the implementation of the project	AAAC	GDE	Take into account under item 1.2.3. (c)
			Evolution of diseases linked to child malnutrition intervention sectors						

E & S Principles of the Adaptation Fund	Positive impact	Negative impact / risks	Mitigation and enhancement measures	Monitoring indicators	Responsible for implementation	Period	Responsible for monitoring	Technical support institution	Cost (X USD)
				Evolution of the rate of food insecurity in the intervention sectors					
Cultural and physical heritage		Risk of destruction of physical and cultural heritage during fortuitous discoveries	Establishment of a system of recovery of fortuitous discoveries of physical heritage	Number of fortuitous discoveries of cultural heritage notified by producers on building sites	PMU	During the implementation of the project	AAAC	DPC ²⁶	5 000
				Percentage of cases of fortuitous discoveries of cultural and physical heritage taken over by the competent institutions	PMU	During the implementation of the project	AAAC	DPC	
Land and soil conservation		Soil and Land Degradation	Develop sustainable land and soil management practices	Land actually cultivated with modern techniques of water and soil conservation	PMU	During operation	AAAC	DPC	Take into account in the output 2.1.3
				Rate of increase in agricultural yields on sites	PMU	During operation	AAAC	GDA	
				Number of producers who have adopted soil improvement practices	PMU	During operation	AAAC	GDA	
				Proportion of use of organic fertilizer	PMU	During operation	AAAC	GDA	
				Volume of inputs consumed (pesticides, herbicides, fertilizers)	PMU	During operation	AAAC	GDA	
			Support for the acquisition of soil analysis equipment	Quality of water and soil quality analysis equipment	PMU	Before operation phase	AAAC	National Laboratory	See Pollution Prevention and Efficient Resource
			Analysis and monitoring of soil quality	Number of water and soil quality analysis conducted	PMU	During operation	AAAC	National Laboratory

The cost of monitoring of an Environmental and Social Management Framework Plan is estimated at 144 000 USD (confer item 2.1.5.2. of the budget).

²⁷ General Directorate of Environment

Grievance mechanism in the framework of the project

The proposed project will utilize the existing BOAD grievance mechanism to allow affected to raise concerns that the proposed project is not complying with its social and environmental policies or commitments.

BOAD has established grievance mechanism through its grievance policy and procedures manual which is an independent mechanism whereby those who have suffered injury, resulting from a project financed or implemented by the BOAD may file a complaint with the Bank. The grievance mechanism, which is made available to stakeholders is a part of the environmental, social and economic sustainability to address compliance and grievance cases that arise from projects implemented by BOAD. **This manual defines the complaint resolution mechanism in the implementation of any project financed or implemented by BOAD. It aims to establish an effective dialogue between those affected by the projects it finances and all interested parties, to resolve the problem or problems at the origin of a request, without seeking to assign responsibility or fault to any of these parties.**

At the BOAD level, the grievance mechanism is coordinated and managed by the Compliance and Regulatory Division (DCR) with the support of Resident Mission of the BOAD in the BOAD's states members. **Affected communities and other stakeholders which will be affected by the project can submit complaints to the BOAD, the IE of the present proposal by mail, email, fax or phone.** In the project area level, the Project management unit is the contact point for any project related complaints from stakeholders. The Project management unit should respond promptly and appropriately to a complaint with the support of the Resident mission and a report is made to the DCR which is based in Headquarter of BOAD. Where the complaint cannot be managed at the project level, the Project Coordinator will direct the complainants to complete a complaint form for submission to the DCR of the BOAD. The Project coordinator should advise complainants to provide complete information, so BOAD can properly assess and address the complaint.

It will be the responsibility of the PMU, under the control of BOAD, to ensure that all relevant stakeholders are adequately informed of the grievance mechanism. This mechanism will be made available at the Governorate of the region and Administrators of the provinces (sectors). Copies of the manual of grievance mechanism will be made available at the villages' level. It will also posted on the project website and the implementing entity (BOAD) website. The procedures on how to submit the complaint are available on the website of the BOAD (www.boad.org) or directly at <https://www.boad.org/en/policies-procedures-guidelines/> (under item "DOCUMENTS OF CONFORMITY AND GRIEVANCE").

If the DCR finds that a complaint is eligible, the DCR composes internal and/or external experts' team to investigate the case and propose options for the complainant to consider. The table below show summary information on compliance review and grievance response.

	Compliance review	Grievance response
Complainant	Any person or group of persons who may be affected by BOAD-supported activities. While anonymous complaints will not be accepted, requests for confidentiality will be respected.	
Channel	<p>Complainants can contact the Compliance and Regulatory Division (DCR) of BOAD via mail, e-mail, fax or phone.</p> <p>The adresse of the DCR : Banque Ouest Africaine de Développement 62 av. de la Libération, BP 1172 Lomé, Togo Tel : +228 22 21 59 06 Fax : +228 22 21 52 67 E-Mail : boadsiege@boad.org Web : www.boad.org</p> <p>Complainants should provide full details to enable the Bank to assess eligibility.</p>	

	Compliance review	Grievance response
	The procedures on how to submit the complaint are available on the website of the BOAD (www.boad.org) or directly at https://www.boad.org/en/policies-procedures-guidelines/ (under item "DOCUMENTS OF CONFORMITY AND GRIEVANCE")	
Eligibility requirements	The complaint is directly related to Environmental, Social and Economic Sustainability issues. The issue concerns a proposed or on-going AF/BOAD project.	
Responsibility within BOAD	Compliance and Regulatory Division (DCR) of BOAD with support of resident Missions in Guinea Bissau and thematic experts	
Response	The DCR investigates the complaint and reports findings and recommendations to the President of the BOAD. The BOAD communicates the decisions and steps that BOAD will take in response to the concerns.	The DCR explores mediation, negotiation, conflict resolution, and/or referral to another dispute resolution mechanism.
Possible results and follow up action	Measures to minimize or mitigate negative impacts from project activities. Revision and disclosure of the project. Permanent suspension of the project.	Proposed measures to address or compensate for negative impacts from project activities. Resolution of issue. Public disclosure of the case.

The details procedures to resolve a grievance in the framework of the project is described in the appendix 5.

- D. Describe the arrangements made for monitoring and evaluation (M & E), including the plan budgeted for monitoring and evaluation.

Monitoring and Evaluation (M&E) of all project activities, including environmental and social consequences, are part of the project management responsibilities of the Ministry of Environment and Sustainable Development (MESD). **These M&E activities will be supervised by BOAD, the implementing entity.** This includes tracking the implementation progress and learning in terms of social and environmental concerns, feedback, and knowledge sharing on results and lessons among the primary stakeholders. The Project Management Unit (PMU) and participating Ministries/technical agencies have built proven capacities in conducting inclusive and consultative processes (e.g. through in the development of Guinea-Bissau's First National Communication on Climate Change and the country's NAPA) which will be essential to mitigate any possible social or environmental risks. Participating farmers and their institutions (RCCF, women's associations, NGOs, etc.) will be key stakeholders in these processes. To screen and assess social and environmental risks, as well as to mitigate potentially adverse impacts, a specific, measurable and time-bound set of indicators reflecting these risks will be integrated in the results framework of the project (to be developed in stage two of this proposal). In general, failure in compliance with the Adaptation Fund's Environmental and Social Policy is believed to be a low risk given that the project focuses strongly on increasing resilience of social and environmental systems in the Project Region.

A monitoring and evaluation of project activities will be set up to assess progress regarding the objectives and outcomes outlined in the project document. It will allow to identify strengths and weaknesses in order to make informed decisions and in time. Monitoring will focus on the implementation of project activities and will be based on the measurement of progress at each critical stage of the process. A first level of monitoring is entrusted to technical project steering committee made up of several actors (State and Non-state involved in the project). At the level of each region of intervention, the regional commission of sustainable development will be the monitoring relay to ensure the smooth running of the project activities. Periodically, the Department of Planning of the Ministry of Agriculture will conduct monitoring and evaluation missions and, produce reports on the level of implementation of the recommendations of the

Technical Steering Committee. One of monitoring tools will be the work and annual expenditures plan which will be validated by the technical steering committee.

The system of M & E of the program will be built around the logical framework as a tool for management, planning and assistance in decision making for all implementing partners.

Several participatory tools will be used to measure project performance. Additional effect/impacts surveys (start, mid-term and completion) and analysis of technical, annual economic and financial performance of farms will measure the project's impact for target groups (improvement of yields, reduction of their poverty and improvement of their resilience). A computerized database will be developed for the project.

Quantitative targets will be approved by the stakeholders at the start of the project when reviewing the logical framework taking into account the intervention sites. A midterm review and a final evaluation are planned in order to assess the changes observed at baseline²⁸. The M & E system will support decision-making for the adoption of actions or activities of resilience for future projects.

The M & E tools will be developed based on existing operational arrangements and the level of ongoing projects (survey sheet, further investigation to assess the effects/impact, monitoring sheets of activities, thematic studies, nominative targeting system, agronomic monitoring system, environmental and social impact, dashboards).

A synergy will be developed between the present project and projects/programs in the regions of Bafatà and Gabù.

The implementing partners are: i) for operational monitoring, the technical services of the ministries involved (environment, agriculture, livestock, rural engineering, hydraulics and rural code); ii) for the dissemination of information on the environment and climate change, NGOs and consulting-services groups (GSC). A regional technical assistance will occur, from time to time, to strengthen quality control.

The monitoring and evaluation will be done through:

- Balance sheet and programming meetings with grassroots actors;
- Weekly Points, monthly, quarterly and annual reviews at the project team level;
- Field visits.

Monitoring and evaluation of the progress made in the implementation of the results of the project will be based on objectives and indicators established in the context of the results framework of the project (see table 27). The activities of monitoring and evaluation will follow the policies and guidelines of the Adaptation Fund as well as those of the BOAD in the matter. Monitoring and evaluation system will facilitate learning, replication and scale upgrading of the results and lessons from the project.

The progress of the project will be checked through the Project Management Unit monitoring and evaluation, the Annual evaluation, the Mid-term evaluation, the Independent Final Evaluation and the Ex-post evaluation. Beyond this, a programme of monitoring and evaluation (M&E), in accordance with Adaptation Fund and BOAD procedures will be carried out by the BOAD Organizational Unit in charge of M&E in collaboration with its Project team and the Directorate of environment and climate change. The BOAD will report to Adaptation Fund secretariat in accordance with the Policies, Guidelines and procedures of Adaptation Fund.

Monitoring and evaluation by the Project Management Unit

For the execution of the project, the PMU will establish a system to monitor the progress of the project. Participatory mechanisms with animators will be put in place for the collection and recording of data to support monitoring and evaluation of the results and activities indicators.

Continuous monitoring of the project will be the responsibility of the PMU and will be guided by the preparation and execution of annual budgeted working plan, supported by a quarterly

²⁸ A baseline situation will be specified at project start for each intervention site

progress report. The annual budgeted working Plans will indicate the activities proposed for the next year and will provide the necessary details on the objectives and the quarterly reports that include information on the follow-up to the implementation of activities and the achievement of the objectives of the result. The Steering Committee will meet twice a year to review the progress of the project. They will assess during the meeting of the end of year, the annual report of management of the project from the previous period and the budgeted annual working plan of the next period. The budgeted annual working plan is established in accordance with the results framework to ensure proper compliance with and monitoring of the results of the project. Reports that are prepared by the PMU specifically in the context of the monitoring and evaluation plan are as follows: (i) the report of the project launch workshop; (ii) the annual budgeted working plans; (iii) quarterly reports; (iv) the annual management reports; (v) technical reports; and (vii) the final report.

All the reports prepared by the PMU and approved by the steering committee will be sent to the BOAD which will send it to Adaptation Fund if required.

- **Project launch workshop and report**

After the approval of the project by the adaptation fund and the BOAD and once that the the PMU is set up, the project launch workshop will be organized. This workshop will be organized at the national level and will bring together all actors involved in the implementation and monitoring and evaluation of the project. During this workshop, the tasks of monitoring and evaluation will include: (i) the presentation of the project results framework with; (ii) the review of monitoring and evaluation indicators; (iii) the preparation of projects of clauses that should be included in tender documents to ensure compliance with the functions of monitoring and evaluation; and (iv) the clarification of the distribution of the tasks of monitoring and evaluation among different actors.

After the launch workshop, the PMU will prepare a report of the project in consultation with the Secretariat for Environment and Sustainable Development. The report will include a description of the functions and the institutional responsibilities and coordination of stakeholders in project activities, start-up activities and an update on any changes in external conditions that may affect the project. It will also include a detailed budgeted annual working plan for the first year and a detailed including indicators monitoring plan.

- **Budgeted annual working plan**

The PMU will submit to the Steering Committee a complete annual budgeted work Plan project. The annual budgeted work Plan should include detailed activities to be performed for each of the outcomes of the project during the monthly periods and the dates to which the objectives and steps of the performance indicators will be carried out during the year. A detailed budget for the project activities to be undertaken during the year, as well as all monitoring and necessary supervision activities will also be included.

The Coordinator will circulate a draft budgeted annual working plan to the Steering Committee and the Secretariat for Environment and Sustainable Development for consideration. The budgeted annual working plan will be presented at the meeting of the Steering Committee for approval.

- **Quarterly progress report**

The PMU will submit quarterly progress reports to the Direction of the water mobilization within 10 days of the end of each quarter. Analysis tools will be used to identify constraints, problems or bottlenecks that hinder the execution of the activities of the project in a timely manner in order to take appropriate corrective actions. This report will present the status of implementation of the environmental and social measures of the sub-projects on the sites including the pests and pesticides management. They are assessed on the basis of systematic monitoring of performance indicators and products identified in the framework of the results of the project. The PMU will forward these reports to the members of the Steering Committee and the MESD.

- **Technical reports**

The technical reports will be prepared as part of the project outputs as well as for documenting and disseminating lessons learned. Drafts of all technical reports should be submitted by the PMU to the Secretariat for Environment and Sustainable Development which in turn be will

presented to the Executive Committee for review and approval and to the Advisory for their information and possible comments, before they are finalized and published. Copies of finalized technical reports will be distributed to the Advisory Committee, the Executive Committee and other project stakeholders, as appropriate.

Annual evaluation

Annual evaluations that involve the project management unit, the Steering Committee of the project, the Implementing Entity (BOAD) and representatives of the beneficiary communities will be conducted. The secretariat of Adaptation Fund could be involved in this evaluation. They will be organized under the supervision of the Planning Director and in collaboration with the coordinator of the project, the preparation of annual progress reports, including recommendations to be submitted for adoption to the Project Steering Committee. They will take into account the progress toward goals, lessons learned, risks management, status of implementation of environmental and social management plans of the subprojects including integrated pests and pesticides management, grievance management, implemented budgets and difficulties. The inspection by the Project Management Unit will be complemented by the financial monitoring by a competent body.

Mid-term evaluation

Two years after the start of the project, a Mid-term evaluation will be conducted independently with one or more independent consultants. The purpose the Mid-term evaluation is to review the progress and effectiveness of project execution in terms of the achievement of objectives, outcomes and outputs. The conclusions and recommendations will be crucial to bring about improvements in overall project design and execution strategy, if needed, for the remaining period of the project. The Steering Committee will complete necessary arrangements for the Mid-term evaluation, in consultation with the General Directorate of Environment and Sustainable Development.

The Mid-term evaluation shall include at the least the following elements:

- an analysis of the project's execution in terms of effectiveness, efficiency and compliance with set timeframes;
- an analysis of the effectiveness of the cooperation mechanisms between the parties;
- identifying issues requiring decisions and corrective actions;
- a proposal for interim corrections and/or adjustments to the execution strategy, as necessary;
- status of implementation of environmental and social management plan of the project;
- Status of integrated pests and pesticides management;
- Grievance management;
- a description of the technical achievements and lessons learned arising from design, execution and project management.

Some of the critical elements to which both the Mid-term evaluation must pay particular attention are:

- the degree of acceptance and involvement of the beneficiaries, communities and local organizations in the information and alert systems established;
- the level of incorporation, among the direct beneficiaries, of practices from the agro technology transfer activities;
- the level of understanding and awareness among decision makers and beneficiaries of the need and importance of measures for adapting to climate change;
- the level achieved in terms of preparation, monitoring and adaptation;
- the reduction of negative impacts achieved in different areas (environmental, social, economic);
- the level of incorporation of measures to adapt to climate change in the policies and action plans and territorial development at regional level and their efficient implementation;
- the degree of participation and representation of women in the planning, training, and execution of project activities and the project's effect on the productive activities of the region.

All the institutions involved in the monitoring and the execution of the project will give their support to this independent mid-term evaluation. It is among other: the Steering Committee of the project, the Implementing Entity, the Directorate- General of Environment, Directorate-General of Agriculture, Directorate-General of Water Resources, Directorate-General of Livestock, Directorate-General of Forests and Fauna, Directorate- General of National Meteorology, Local Government, Institute of Women and Children, Regional Centre for the Provision of Drinking Water and Low Cost Sanitation, National Institute of Agrarian Research, National Institute of Research and Applied Technology

The report of the Mid-term evaluation will be submitted to the Minister of Environment who will send it to the Minister of planning, the Implementing Entity.

Independent Final Evaluation

Shortly before the completion of the project an Independent Final Evaluation will be made by one or more independent consultants. The purpose of this evaluation is to describe project impacts, sustainability of results and the degree of achievement of long-term results. The Independent Final Evaluation should also indicate any future actions needed to ensure the sustainability of project results, expand the impact in successive phases, integrate and increase products and practices and disseminate the information obtained amongst the authorities and institutions with competencies in adapting to climate change in rural areas, so as to ensure the continuity of the processes initiated by this project. **The independent final evaluation will assess the status of implementation of environmental and social measures including the integrated pests and pesticides management.** **The independent final evaluation will also assess the grievance management during the project implementation.**

Final Report

Within 3 months before the date of completion of the project, the Project coordinator will present to the MESD, the draft of the final report. The main purposes of the Final Report are to provide guidance to ministers and officials on political decisions necessary for following up the project and to present the donor information on the use of funds. As such, the final report will consist of a brief summary of the main products, findings, **the global status of implementation of environmental and social measures during the project, lessons learned of the environmental and social management including the integrated pests and pesticides management, grievance management,** conclusions and recommendations for the project, the descriptions or technical details. The final report will include an assessment of activities, a summary of training and recommendations expressed in terms of their practical application. This report shall specifically include the findings of the final evaluation. Prior its finalization, a project evaluation meeting should be held to discuss the Final Report draft with the General Directorate of Environment. The final report will be submitted to the Steering Committee for approval.

Ex-post evaluation

In accordance with BOAD procedures, an ex-post evaluation is conducted two or three years after the end of a project. This activity will therefore financed and conducted by BOAD to measure the impact of the project on beneficiaries.

The costs associated with implementing of M&E system are detailed in the table below.

Table 23: Implementation of M&E system costs

Activity	Responsible Party	Timeframe / Frequency	Budgeted Costs (USD)	Budgetary Reference
Launch Workshop	PMU, GDE ²⁹	the start of the project	5 000	Project management cost (line 4.3.1)
Project Launch Report	PMU	Days after the Launch workshop		
Annual Operating Plan and Budget validation	PMU, Steering Committee	Annual	6 000	Included in project management cost (Steering committee meeting) (line 4.3.4)
Field Impact Monitoring and Progress Evaluation	PMU, GDE,	Annual	5 000	included in project management cost (line 4.3.6)
Quarterly progress Reports	PMU	Quarterly	-	Included in project management cost (work of the PMU members)
Annual Management Reports	PMU	Annual	-	
Evaluation of Technical Reports	GDE, PMU, Steering Committee and with contributions from institutions involved in the monitoring and the execution of the project	Annual	10 000	Included in project management cost (Steering committee meeting) (line 4.3.4)
Mid-term evaluation and report	External consultant/s, Steering Committee contributions from institutions involved in the monitoring and the execution of the project	Halfway through project implementation	9 000	Included in project management cost (line 4.3.7)
Final Evaluation and report	External consultant/s, GDE, PMU Steering Committee and others	Half way through project implementation	10 000	Included in project management cost (line 4.3.8)
Total			44 000	

The Monitoring and evaluation functions of the implementing entity (BOAD) are defined in the table 18. The costs associated with implementing Entity monitoring are detailed below.

Table 24: Implementing entity monitoring /supervision costs

Specialized Technical Services	Responsible Parties at BOAD	Budget US\$	Time frame
Quarterly reports	Programme manager and Monitoring and Evaluation Unit	30 000	Quarterly
Monitoring and Annual progress reports	Programme manager and Monitoring and Evaluation Unit	10,000	At the end of each year
Mid-term Evaluation	Programme manager and Monitoring and Evaluation Unit External Consultants	10,000	At the mid-point of programme implementation.
Final Evaluation	Programme manager and Monitoring and Evaluation Unit External Consultants	10,000	At least three months before the end of programme implementation
Project terminal Report	Programme manager and Monitoring and Evaluation Unit External Consultants	5,000	At least three months before the end of the programme
Audit	Programme manager and internal audit unit	30,000	Yearly

²⁹ General Directorate of Environment

	External Consultants		
Visits to field sites	Programme manager and Internal audit unit Monitoring and Evaluation Unit External consultants Government representatives	10,000	Yearly
TOTAL INDICATIVE COST		US\$105,000	

Environmental and social monitoring program

Despite the knowledge of certain environmental and social phenomena related to generic impacts of the project activities, it nevertheless remains that there is still a degree of uncertainty in the accuracy of other impacts, particularly regarding diffuse impacts and residual impacts. For this reason, it is necessary to develop an environmental monitoring program. The latter shall verify the correctness of the evaluation of certain impacts, assess the effectiveness of mitigation measures implemented and allow to make proposals for possible corrective action when necessary. The environmental monitoring program will present the indicators to monitor the mitigation and improvement measures. Moreover, the environmental and social monitoring will track the evolution of the state of the environment, including the sensitive elements, using relevant indicators on the environmental components established on a consensual basis by the various stakeholders in the execution. The monitoring indicators as well as some parameters should be redefined and refined following completion of detailed environmental studies

Responsibilities of environmental and social risks monitoring

Environmental monitoring and monitoring will be provided by the Competent Environmental Assessment Authority (AAAC) in collaboration with the General Directorate of Environment (GDE) in relation to the Project Management Unit. From the point of view of institutional arrangements, at the central level, environmental monitoring will be the primary responsibility of AAAC. This mission will be carried out in collaboration with the General Directorate of Agriculture (GDA) and other structures involved in the project.

All the results of the monitoring should also be discussed and shared during the sessions of the National Project Steering Committee for validation. At regional and local level, the monitoring and monitoring system defined at the central level will be based on the Regional Environmental Directorates of Gabù and Bafatà in collaboration with the Regional Directorates for Agriculture and other devolved technical services (livestock, water and forest, civil protection, etc).

The capacity-building activities to be carried out include training for these different actors in order to ensure appropriation of the content of the Environmental and Social Management Plan. They also cover field missions in the context of the implementation of the monitoring and environmental monitoring program.

The project implementation manual should take into account the Environmental and social management plan (ESMP) of the project. The Project Management Unit will be responsible for the implementation of the ESMP. As for the AAAC, it will oversee the monitoring and evaluation of the implementation of the ESMP, in accordance with the environmental procedures of Guinea Bissau and taking into account the 15 E&S principles of Adaptation Fund.

In order to overcome the monitoring tasks, the AAAC will be supported by the technical institutions, namely: (i) the Directorate of Plant Protection for all matters relating to the management of pests and pesticides ; (ii) the General Directorate of Environment; (iii) the General Directorate of Agriculture and its regional services; (iv) the Directorate General of

Rural Engineering (v) the Directorate of Forests and Livestock; (vi) Services for water management and village water supply,; (vii) the National Institute of Statistics; (viii), the General Directorate of Water and Forests ; (ix) the National Institute for Agrarian Research (INPA) ; (x) the Directorate General of Civil Protection; etc.

Responsibilities for monitoring the Integrated Pest Management Plan

In Guinea Bissau, three technical ministries are mainly concerned with the management of pests and pesticides:

- the Ministry of Agriculture through the Directorate of plant protection (DPV), for pesticides used in agriculture;
- the Ministry of the Environment and Sustainable Development, which is responsible for all chemicals, including pesticides and the framing of measures of their impact on the environment; and
- the Ministry of Public Health, responsible for the treatment of cases of poisoning by pesticides including those used in public health).

In the framework of the present project, the monitoring of the integrated pest and pesticide management plan will be expanded to include the following institutions:

- the Regional Directorates for Plant Protection;
- **the national comity of pesticides management (CNGP);**
- the Regional Directorates for Environment and Sustainable Development;
- the Regional Directorates of Agriculture;
- the competent environmental assessment authority (AAAC);
- the Regional Directorates of Public Health;
- the representatives of the Governorate of the region
- the civil protection service;
- the National Laboratory for Agrarian Research (INPA);
- the representatives of NGOs.

Supervision by the Implementation entity

All environmental and social monitoring activities will be conducted under the supervision of the implementing entity (BOAD), which will send monitoring reports to the Adaptation Fund.

In accordance with the ES policy of the Adaptation Fund, project monitoring and evaluation by the implementing entity must take into account all identified environmental and social risks and impacts.

The implementing entity will assess the implementation of the integrated pests and pesticides management plan measures through the periodic reports submitted by the PMU and its field verification missions. To this end, the BOAD will oversee the process of recruiting FAO integrated pest and pesticides management Expert for the training of actors involved in the project on integrated management of pests and pesticides. It will oversee all training activities and the application of best practice measures in the field.

The PMU will submit to the BOAD the report on the Environmental and social management plan. This report will take into account the management of the 15 principles of the Adaptation Fund. This report should included the pest and pesticides managements and the grievance management. The BOAD will evaluate the content of the monthly reports of the PMU and give to the PMU its comments on environmental and social management. The IE will verify in each next report if the comments on the previous reports are taken into account and the shortcomings corrected.

In addition, the BOAD will organize every three months a field missions to verify the level of implementation of the ESMP and recommend specific corrective actions that ensure that the project complies with the E&S principles of the Adaptation Fund.

The BOAD may receive the support of external consultants for a second opinion on the performance of the environmental and social measures implementation and the monitoring system. In the event of a grievance, the Environmental, Social and Legal Offices of the BOAD will clarify the situation and find the appropriate solutions to the problems posed. The annual reports to be submitted by the BOAD to the Adaptation Fund on the project implementation will include a section on the status of implementation of the environmental and social management plan and how the environmental and social risks/impacts are avoided, minimized or mitigated. The reports shall also include a description of the shortcomings corrections. The Implementation Entity's annual report will also include a section on the on the pests and pesticides management in the framework of the implementation of the Project Environmental and Social Management Plan. The mid-term and final evaluation reports will also include an assessment of the project's performance in relation to environmental and social risks including pest and pesticides management and grievance management.

To assess the effectiveness of project activities, the environmental and social monitoring indicators are proposed (see table 23).

E. Include a results framework for the project proposal, including milestones, targets and indicators.

Table 25: Result framework

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
General Objective: <i>strengthen practices and capacities in climate-smart agriculture practices in the project region and at institutional level</i>	Number of the project beneficiaries	0	54 516 persons of which (28 075 women, beneficiaries of the 1762 ha irrigated areas with the infrastructures developed to build resilience of the population for their food security with: <ul style="list-style-type: none"> - 24 516 persons (4000 agricultural groups or households) direct beneficiaries of 1362 hectares developed for rice production - 16800 persons (2800 agricultural groups or households) direct beneficiaries of market gardens production - 6000 persons (1000 breeders groups or household) direct beneficiaries of 1000 ha of pasture - 7200 persons (1200 households) direct beneficiaries of the water supply 	Monitoring and evaluation reports	Disponibility of financial resources Political willness of national and local governments Selection of vulnerable and very active people who have shown interest in the project
<i>Component 1: Development of technical and institutional capacity to address the increase of climate risk with the</i>	Level of technical and institutional capacity of national and local government institutions and experts, farmers groups,	Lack of technical and institutional capacity to address the increase of	The capacities of 6 Ministries and local government services (agriculture, livestock, hydraulic, forest, environment, civil protection) are built to	Monitoring and evaluation reports	Effective involvement of technical services and ministries

Output 1.1.1. Socio-climatic vulnerability assessment for East Guinea-Bissau	Number of socio-climatic vulnerability assessment for East Guinea-Bissau	Lack of data related to socio-climatic vulnerability	1 assessment document on socio-climatic vulnerability available for East Guinea Bissau with data for adaptation actions planning 1 Guideline on local socio-climatic vulnerability assessment available	The assessment report The Guideline on local socio-climatic vulnerability assessment	Full participation and involvement of local public services
Output 1.1.2. Assessment of technical capacity building needs of ministries and field operatives for adaptation planning	Number of key ministries with needs in adaptation planning identified	Lack of capacities of key ministries experts in adaptation planning	1 report on assessment of technical capacity building needs of ministries and field operatives for adaptation planning	report on assessment of technical capacity building needs of ministries and field operatives for adaptation planning	Full participation and involvement of government institutions and local services
Output 1.1.3. Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources	Number of detailed intervention plan for pilot climate-smart agriculture actions prepared Number of policies and plans revised to take in account climate change adaptation issues and natural resources sustainable management	Absence of detailed intervention plan for pilot climate-smart agriculture actions The National agricultural development policy letter, the of the National policy letter for the livestock development; The National Master plan of water and sanitation The Regional development plan of Gabu and local development plan of Pirada and Pitche are reviewed	01 detailed intervention plan for pilot climate-smart agriculture actions for East-Guinea Bissau elaborated The forest management policy is reviewed to take into account the climate change issues The regional development plan of Bafata is reviewed to take into account the climate change issues	Detailed intervention plan for pilot climate-smart agriculture actions for East-Guinea Bissau Improved forest management policy Improved regional development plan of Bafata	Full participation and involvement of national and local development stakeholders (government institutions, local government, NGOs, Associations, private sectors, populations, etc.)

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
	Number of policies, procedures and guidelines elaborated and implemented		3 local development plans are reviewed to take into account the climate change issues in the sectors of Sonaco, Contuboe and Ganadu At least 10 policies, procedures and guidelines drafted to include environmental and social safeguards and gender issues, are approved and implemented	Improved local development plans taking into account the climate change issues in the sectors of Sonaco, Contuboe and Ganadu Documents of policies, procedures and guidelines prepared Implementation report of the policies, procedures and guidelines prepared	
Outcome 1.2. Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning	Number of farmers groups, private professionals of development, associations trained on climate-smart agriculture knowledge to control flooding, to maintain agricultural production, livestock and population water supply in drought periods	267 producers of which 58 women are trained on the techniques on Zai, rotation, association of cultures and transverse plowing in LDCF project	At least 4 000 new producers of which 2060 women are trained on-site in climate-smart agriculture practices	Monitoring report	Full participation and involvement of national and local development stakeholders (government institutions, local government, NGOs, Associations, private sectors, populations, etc.)
Output 1.2.1. Technical trainings on adaptative systems and organizational capacity building for ONGs and identified target groups	Number of NGO trained Number of beneficiaries trained on adaptative systems	The trainings on the consequences of the adverse impacts of climate change and adaptive measures in terms of small-scale irrigation are insufficient in project area 267 producers of which 58 women are trained on the	Capacities of at least 5 NGOs have been strengthened to organize producer groups into management committees and train them in their mission 40 sessions per year in two years (i.e two sessions on each project site) are conducted for beneficiaries to build their capacities on adaptative systems At least 4 000 new producers of which 2060 women are	Training report Training reports On-site Practical training on resilient Climate Change Practices report	Involvement of beneficiaries to apply the knowledge and practices for adaptation to climate change Sensitization of beneficiaries to overcome possible cultural barriers

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
	Number of groups whose organizational capacities are strengthened	<p>techniques on Zai, rotation, association of cultures and transverse plowing in LDCF project</p> <p>Lack of groups organization in finance and management</p>	<p>trained on-site in climate-smart agriculture practices</p> <p>At least 200 famers groups benefited from financial and management capacities building</p>	Organizational training report	
1.2.2. Technical assistance and rural extension for subprojects	Number and type of technical assistance provided for subprojects development	Lack of technical assistance to producers	100% of beneficiaries benefited from technical assistance of decentralized services	Technical assistance report	Full participation and involvement of public decentralized services
1.2.3. Formulation/Update of contingency plans for climate-risk management on the micro-dams level	Number of formulation/ updated contingency plan to manage flood risks	Contingency plan inexistent in the project areas	<p>01 Conteingency formulated</p> <p>21 Sites contingency plan adapted</p> <p>At least 75% of beneficiaries population mastered the contingency plan and are able to address climate change risk</p>	<p>Contingency plan</p> <p>Monitoring report</p>	Involvement of target area Civil protection and beneficiaries
Output 1.2.4. Support for famers groups by the government technical experts for adaptation actions	<p>Percentage of producers that benefited from technical support services for the implementation of adaptation measures</p> <p>Level of gender integration and environmental and social measures in the framework of the project</p>	<p>Very lack support of the technical services to producers</p> <p>Non application of environnemental, social and gender issues due to lack of knowledge</p>	<p>100 % of beneficiaries benefited the technical support of decentralized services</p> <p>100% environnemental, social and gender measures are applied</p>	<p>Basic data collected on sites</p> <p>Trimestrial management report</p> <p>Mid-term evalautaion report</p>	Full participation and involvement of beneficiaries and public decentralized services

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
Output 1.2.5. Capacity building to prevent forest fires	Number of fire brigades put in place Percentage of fire brigades organized and training on forest fire prevention	Lack of fire brigades in the project area	At least 40 fire brigades are put in place 100 % of fire brigades capacities are built to prevent and combat bushfire	Meeting and training reports	Full participation and involvement of civil protection, forest services, Rural Climate Change Forum (RCCF) and Environmental Vigilance Committees (CRA) Involvement fire brigades members Involvement of the head villages and the population
<i>Component 2: Enhance the resilience of existing agricultural productive systems, including water control</i>	Percentage of the targeted population aware of the adverse impacts on climate change foreseen and the adequate responses	Low percentage of the targeted population aware of the adverse impacts on climate change foreseen and the adequate responses	75% of the targeted beneficiaries aware of the adverse impacts on climate change foreseen and the adequate responses	Monitoring and evaluation of resilience and adaptive actions report	Full participation and involvement of national and local development stakeholders (government institutions, local government, NGOs, Associations, private sectors, populations, etc.)
Outcome 2.1. Agricultural activities are climate-smart and contribute to sustainable increased in productivity and enhanced national food security	Average of increased yield of rice and others crops (kg / ha), measured at site level – showing improvements compared to national and/or regional average (Gabù and Bafatà) due to climate-smart agriculture practices Number of beneficiary who have improved their food security, at least with regard to rice as a staple food	600 kg/ha of rice 10000 kg/ha of potatoes 8000kg/ha of tomato 8000 kg/ha of onion 42% of the needs of rice of the beneficiaries are not satisfied	4000 t/ha of rice 25000 kg/ha of potatoes 22000kg/ha of tomato 23000 kg/ha of onion 100% of the needs of rice of the beneficiaries are satisfied	Annual reports	Reluctance to apply the knowledge and practices for adaptation to climate change Cultural barriers in accepting new techniques can be expected.
Output 2.1.1. Development of lowlands to maintain agricultural production in drought periods	Number of hectare of lowlands developed	Lack of infrastructures to develop irrigation	1000 ha of lowlands developed to maintain agricultural production in drought periods	Annual reports	Full participation and involvement of beneficiaries

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
	Water availability to maintain agricultural production in drought periods				
Output 2.1.2: Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply	Number of hydraulic infrastructure to raise water for irrigation and livestock Percentage of satisfaction of the water needs of plants	Lack of infrastructures to develop irrigation and prevent site silting Water needs of insufficient plants affecting production (ie. Irregularity of irrigation and not controlled and early drought)	20 micro-dams constructed for irrigation of rice and vegetable crops and rain and storm water retention systems for improved livestock water supply 100% of the water needs of plants met with a controlled irrigation	Annual reports	Full participation and involvement of beneficiaries
Output 2.1.3. Rehabilitation/improvement of soil productivity and small-scale investments into agriculture inputs, machinery and tools	Number of population sensitized about the harms of slash and burn agriculture practice on soil fertility and crop yields Percentage of targeted population applying adaptation measures	Lack of sensitization campaigns on the harms of slash and burn agriculture practice on soil fertility and crop yields 55 % of producers trained in the framework of the LDCF project are applying adaptatives techniques 0 producers trained on techniques of Intensive rice	At least 50 000 beneficiaries are sensitized on the harms of slash and burn agriculture practice on soil fertility and crop yields At least 75% of beneficiaries apply climate-smart agriculture practices on the adaptation project sites At least 200 producers of which 110 women are trained on techniques of Intensive rice growing system (SRI)	Sensitization reports Field impact evaluation report Field impact evaluation report	Full participation and involvement of beneficiaries Involvement of the PMU

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
	<p>Nombre de producteurs formés sur la technique de multiplication des semences</p> <p>Average agricultural productivity crops (kg / ha), measured at site level – showing improvements compared to the baseline</p> <p>Number of hectare developed for forage production</p> <p>Number of breeders and farmers trained on organic fertilizer production</p>	<p>growing system (SRI)</p> <p>28 producers trained on the technique of the multiplication of the rice seeds and produce seeds</p> <p>600kg/ha for the rice</p> <p>10000 kg/ha of potatoes</p> <p>8000kg/ha of tomato</p> <p>8000 kg/ha of onion</p> <p>16.5 hectares of Brachiaria (forage) installed for 468 breeders (or 0.035 ha by people) under the LDCF project</p> <p>80 breeders trained (40 men and 40 women) on the technical production of fertilizers organic from feces of livestock</p>	<p>At least 400 producers trained on the technique of multiplication of rice and produce seeds</p> <p>4000 kg/ha for the rice</p> <p>25000 kg/ha for potatoes</p> <p>22000kg/ha of tomato</p> <p>23000 kg/ha of onion</p> <p>1000 hectare of forage (brachiaria and leguminous plants) installed for 6000 people (0.156 ha by people)</p> <p>At least 500 breeders and farmers which of 250 women trained in the technical production of fertilizers organic from feces of livestock</p>	<p>Training report on the multiplication of seeds</p> <p>Monitoring report</p> <p>Agriculture campaigns report</p> <p>Data collected by project animators</p>	

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
	<p>Number of rain gauges installed to support the monitoring of the adaptation of agriculture to climatic disturbances</p> <p>Number of mission of monitoring and analysis of water and soil quality</p>	<p>Lack of rain gauges in the project area</p> <p>Absence of water and soil quality analysis in the project area</p>	<p>120 rain gauges installed to support the monitoring of the adaptation of agriculture to climatic disturbances</p> <p>Equipment of the of the soil and water quality analysis available</p> <p>At least one mission for water and soil quality analysis is carried out per year</p>	<p>Data collected</p> <p>Quality of the soil and water analysis equipment</p> <p>Analysis report of technical services</p>	
Output 2.1.4. Construction of drills and ramps for improved livestock and domestic water supply and market gardens development	<p>Number of drinking water points created to supply drinking water to the population</p> <p>Number of hectare developed for market gardening and number of beneficiaries</p>	<p>Lack of drinking water points for home consumption</p> <p>Lack of market gardening undertaken due to lack of water</p>	<p>30 wells of water and 5 ramps to access River Corubal to improve the supply of drinking water for the population and livestock</p> <p>400 ha of new market gardens are developed</p> <p>16 800 persons benefit from gardening activities</p>	<p>Monitoring report</p> <p>Annual report</p> <p>Evaluation report</p>	Full participation and involvement of beneficiaries
<i>Component3: Knowledge management of lessons learned on climate-smart agriculture and adaptation planning</i>	<p>Strong knowledge management strategy is put in place and operational</p> <p>Lessons learned are disseminated in the all regions of the Country</p>	Only two sectors of one region are benefited the dissemination of climate-smart agriculture practices	At least 4 regions of the country will benefit the dissemination of climate-smart agriculture practices	<p>Document of strategy for dissemination of knowledge and lessons learned from the project</p> <p>Report of lessons learned dissemination</p>	Full involvement of the PMU and beneficiaries

Logic intervention	Indicator	Basic data	Target	Mean of verification	hypothesis / Risk
Outcome 3.1 Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries	Lessons learned from the project are disseminated through a knowledge management strategy, a manual and other materials on best practices and measures for climate-smart agriculture, a website at the local, national and regional level	Absence of knowledge management strategy, a manual and other materials on best practices and measures for climate-smart agriculture, a website at the local, national and regional level	knowledge management strategy, manual and other materials on best practices and measures for climate-smart agriculture, a website at the local, national and regional level will be put in place	Report of lessons learned dissemination Final report	Full involvement of the PMU and beneficiaries
Output 3.1.1. Knowledge management strategy developed	strategy for dissemination of knowledge and lessons learned available	Absence of strategy for dissemination of knowledge and lessons learned	One strategy for dissemination of knowledge and lessons learned available	strategy for dissemination of knowledge document	Full involvement of the PMU and beneficiaries
Output 3.1.2. Project website developed and active	Website available for project information diffusion	Absence of Website for project information diffusion	Operationalization of project website	Operational website on project information dissemination	Full involvement of the PMU and beneficiaries
Output 3.1.3. Manual and other materials on best practices and measures for climate-smart agriculture are developed	Number of manuals of good practice on climate-smart agriculture developed and disseminated	Absence of manuals of good practice on climate-smart agriculture	One manuals of good practices on climate-smart agriculture developed and disseminated	manuals of good practice on climate-smart agriculture	Full involvement of the PMU and beneficiaries
Output 3.1.4. Dissemination of results to other regions of Guinea-Bissau and West Africa	Number of regions and populations affected by the dissemination of the results of the project	The climate smart agriculture has not yet experienced expansion in many regions and in West Africa countries	The dissemination of the project results and lessons learned has been effective in, at least, of 4 regions and in West Africa countries	Lessons learned dissemination report	Full involvement of the PMU and beneficiaries

F. Demonstrate how the project / programme aligns with the Results Framework of the Adaptation Fund

Table 26: Aligns of the project with the Results Framework of the Adaptation Funds

Project Objective (s) <u>19</u>	Project Objective Indicator(s)	Fund Outcome	Fund Outcome Indicator	Grant Amount (X 1000 USD)
OS1. Develop technical and institutional capacity of government and civil society (private sector, local communities, NGOs) to address increasing climatic risk in climate change adaptation planning	Number of beneficiaries informed about issues related to climate risk through the actions of meteorological services, the soil and water analysis and the actions against flooding and bushfires	Outcome 1: Reduced exposure at national level to climate-related hazards and threats	1. Relevant threat and hazard information generated and disseminated to stakeholders on a timely basis	700
	Level of technical and institutional capacity of national and local government institutions and experts to address the increase of climate risk with the adaptation practices and planning	Outcome 2: Strengthened institutional capacity to reduce risks associated with climate-induced socioeconomic and environmental losses	2.1. Number and type of targeted institutions with increased capacity to minimize exposure to climate variability hazards	
	Number of the local population beneficiaries of the project aware of the negative impacts of climate change and appropriate responses	Outcome 3: Strengthened awareness and ownership of adaptation and climate risk reduction processes at local level	3.1. Percentage of the target population aware of the negative impacts of climate change and appropriate responses	
	Percentage of beneficiaries who have adopted the climate-smart agriculture practices		3.2. Modification in behavior of targeted population	
	Number and type of policies, procedures and guidelines enhanced or put in place which integrated climate-smart related	Outcome 7: Improvement of policies and regulations that promote and enforce resilience measures	7. Climate change priorities are integrated into national development strategy	
OS2. Enhance the resilience of existing agricultural productive systems and contribute to the diversification of production, including via implementation of	Number of small-scale irrigation infrastructure, micro-dams and drills put in place to control flooding, to maintain agricultural production, livestock and population water supply in drought periods	Outcome 4: Increase of capacity to adapt to climate change within development areas and regarding the relevant natural resources	4.2. Physical infrastructure improved to withstand climate change and variability-induced stress	7 550

climate-resilient water control and management actions to minimize risks from intense droughts and floods	Percentage of the target beneficiaries by means of resilient livelihoods to climate change suffered	Outcome 6: Diversify and strengthen livelihoods and sources of income for vulnerable people in targeted areas	6.2. Percentage of the target population by means of resilient livelihoods to climate change suffered	
OS3. Promote knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning to other regions of the country, other countries in West Africa and to international climate change negotiations and fora, including the UNFCCC process	Strong knowledge management strategy is put in place and operational Lessons learned are disseminated in the all regions of the Country	Outcome 1: Reduced exposure to climate-related hazards and threats	1. Relevant threat and hazard information generated and disseminated to stakeholders on a timely basis	150
Project Outcome(s)	Project Outcome Indicator(s)	Fund Output	Fund Output Indicator	Grant amount (USD)
Outcome 1.1. Increased technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions	Number of staff trained to help beneficiaries to use climate-smart agriculture practices to respond and mitigate the impacts of climate-related events Capacity of national and regional staff to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions Number of policies, procedures and guidelines enhanced or put in place which integrated climate-smart strategies and practices	Product 2.1 : Capacity building of centers and national and regional networks to respond quickly to extreme weather events Output 7: Improved integration of climate-resilience strategies into country development plans	2.1.1. Number of staff/agent trained to respond to and mitigate the impacts of climate-related events 2.1.2. Capacity of staff to respond to, and mitigate impacts of, climate-related events from targeted institutions increased 7.2. No. or targeted development strategies with incorporated climate change priorities enforced	242.5

Outcome 1.2 Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, environmental, social and gender in practice (on-site) and adaptation planning	Number of farmers groups, private professionals of development, associations trained on climate-smart agriculture knowledge to control flooding, to maintain agricultural production, livestock and population water supply in drought periods	Output 3 : Targeted population groups involved in sensitization activities for the adaptation and risk reduction	3.1.1 Number and type of risk reduction actions or strategies introduced at local level	457.5
Outcome 2.1. Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security	Number of small-scale irrigation infrastructure, micro-dams and drills put in place to control flooding, to maintain agricultural production, livestock and population water supply in drought periods Reduction rate of food insecurity in the project area with the climate-smart agriculture practices	Output 4: Physical, natural and social vulnerable assets strengthened in response to the impacts of climate change, including climate variability Output 6: Targeted individual and community livelihood strategies strengthened in relation to climate change impacts, including variability	4.1.2. Number of physical assets strengthened or constructed to withstand conditions resulting from climate variability and change (by type of assets) 6.2.1. Type of income sources for households generated under climate change scenario	7550
Outcome 3.1 Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries	Lessons learned from the project are disseminated through a knowledge management strategy, a manual and other materials on best practices and measures for climate-smart agriculture, a website at the local, national and regional level	Product 7: Better integration of climate resilience strategies into national development plans	7.1. Type and sector of policies introduced or adjusted to meet the risks of climate change	150
Total				8 400

The Adaptation Fund core indicators suggested to be monitored during the project implementation are below.

The Adaptation Fund core indicators suggested to be monitored during the project implementation are below.

Table 27: **Adaptation Fund Core Impact Indicator “Assets Developed”**
Adaptation Fund Core Impact Indicator “Assets Developed”

Adaptation Fund Core Impact Indicator “Assets Developed”				
Date of Report				
Project Title	Scaling up climate-smart agriculture in East Guinea Bissau			
Country	Guinea Bissau			
Implementing Agency	WEST AFRICAN DEVELOPMENT BANK (BOAD)			
Project Duration	05 YEARS			
	Baseline	Target at project approval	Adjusted target first year of implementation	Actual at completion
AGRICULTURE AND LIVESTOCK				
Targeted Asset Developed Development of small-scale irrigation infrastructure, micro-dams and drills to control flooding, to maintain agricultural production, livestock and population water supply in drought periods	0	Development of : - 5 small-scale irrigation systems to develop 750 ha of lowlands with dykes and dams of retention and fragmentation, of anti-erosion protection and of the slopes management against the silting up ((output 2.1.1) - 15 micro-dams to develop 912 ha for irrigation of rice and vegetable crops and rain and storm water retention systems for improved livestock water supply (output 2.1.2)		
Drinking water supply Water supply with drills and ramps	0	- 30 drills and 5 ramps for improved livestock and domestic water supply and 100 ha of market gardens development (output 2.1.4)		

Table 28: Adaptation Fund Core Impact Indicator “Number of Beneficiaries”

Adaptation Fund Core Impact Indicator “Number of Beneficiaries”				
Date of Report				
Project Title	Scaling up climate-smart agriculture in East Guinea Bissau			
Country	Guinea Bissau			
Implementing Agency	WEST AFRICAN DEVELOPMENT BANK (BOAD)			
Project Duration	05 YEARS			
AGRICULTURE AND LIVESTOCK	Baseline	Target at project approval	Adjusted target first year of implementation	Actual at completion ³⁰
Direct beneficiaries of the 1762 irrigated areas with the infrastructures developed to build resilience of the population for their food security	0	54 516 beneficiaries of the 1762 ha irrigated areas with the infrastructures developed to build resilience of the population for their food security with: <ul style="list-style-type: none"> - 24 516 persons (4000 agricultural groups or households) direct beneficiaries of 1362 hectares developed for rice production (Output 2.1.1. and 2.1.2) - 16800 persons (2800 agricultural groups or households) direct beneficiaries of market gardens production - 6000 persons (1000 breeders groups or household) direct beneficiaries of 1000 ha of pasture - 7200 persons (1200 households) direct beneficiaries of the water supply 		
Women direct beneficiaries of the 1762 irrigated areas with the infrastructures developed to build resilience of the population for their food security	0	At least 28 075 women beneficiaries of the 1762 ha irrigated areas with the infrastructures developed to build resilience of the population for their food security (Output 2.1.1., 2.1.2, 2.1.4)		
Indirect beneficiaries of the project	0	44 454 indirect beneficiaries of the crops production for their food security (Output 2.1.1., 2.1.2, 2.1.4)		
Female indirect beneficiaries of the irrigated areas with the modern techniques systems to build resilience of the population for their food security	0	22 893 womens indirect beneficiaries of the crops production for their food security (Output 2.1.1., 2.1.2, 2.1.4)		
Youth indirect beneficiaries of the irrigated areas with the modern techniques systems to build resilience of the population for their food security	0	462 960 young indirectly beneficiaries of 1000 hectares of developed sites through modern irrigation techniques (Output 2.1.1.)		

³⁰ At project completion, the proponent could report on % targeted population reached or successfully supported (the absolute numbers could then be deduced from that figure)

- G. Include a detailed budget with budget notes, a budget on the use of management fees Implementing Entity, and an explanation and breakdown of implementation costs

In accordance with the PCN endorsed by the Board of the Adaptation Fund by Decision B.27/9 during its 27th meeting on 17 and 18 March 2016 in Bonn, Germany, the total cost of the project amounts is USD 9,979,000.

Implementing Entity (BOAD) Specialized technical services budget

The implementing entity fee will be utilized by BOAD to cover its indirect costs in the provision of general management support and specialized technical support services. The table below provides an indicative breakdown of the estimated costs of providing these services.

Table 29: Implementation technical services budget

Step	Indicatives services	Indicative cost
Identification, Sourcing and Screening of ideas	<ul style="list-style-type: none"> - Provide information on substantive issues in adaptation associated with the purpose of the Adaptation Fund (AF). - Engage in upstream policy dialogue related to a potential application to the AF. - Verify soundness and potential eligibility of identified idea for AF. 	<i>US\$ 35,000</i>
Feasibility Assessment / Due Diligence Review	<ul style="list-style-type: none"> - Provide up-front guidance on converting general idea into a feasible project; - Source technical expertise in line with the scope of the project; - Verify technical reports and project conceptualization; - Provide detailed screening against technical, financial social and risk criteria and provide statement of likely eligibility against AF requirements; - Determination of execution modality and local capacity assessment of the national executing entity; - Assist in identifying technical partners; - Validate partner technical abilities; - Obtain clearances from AF. 	<i>US\$ 90,000</i>
Development & Preparation of project	<ul style="list-style-type: none"> - Provide technical support, backstopping and troubleshooting to convert the idea into a technically feasible and operationally viable project; - Source technical expertise in line with the scope of the Project needs; - Verify technical reports and project conceptualization; - Verify technical soundness, quality of preparation, and match with AF expectations; - Negotiate and obtain clearances by AF; - Respond to information requests, arrange revisions; - etc. 	<i>US\$ 108,000</i>
Selection of the sub-project	<ul style="list-style-type: none"> - Conduct subprojects screening; - Control the preparation of the TOR of subprojects environmental and social impact assessments; - Deliver no-objection on the TOR; - Supervise the selection of consultants to prepare subproject ESIA; - Reviews the sub-projects ESIA reports and ensures that assessment have been completed in accordance with the AF Policy; 	<i>US\$ 40,000</i>

Step	Indicatives services	Indicative cost
Implementation of the project	<ul style="list-style-type: none"> - Oversee subprojects approval; - Disclose the subproject ESIA reports and give information to the people concerned and others stakeholders. - Technical support in preparing TORs and verifying expertise for technical positions; - Oversee the process of recruiting consultant (FAO experts) for the training on integrated pests and pesticides management ; - Oversee all training activities and the application of best practice measures in the field ; - Provide technical and operational guidance project teams; - Verification of technical validity / match with AF expectations of inception report; - Manages the grievance process and ensures that the complainants have been satisfied with the resolution of their complaint ; - Provide technical information as needed to facilitate implementation of the project activities; - Provide advisory services as required; - Provide technical support, participation as necessary during project activities; - Provide troubleshooting support if needed; - Provide support and oversight missions as necessary; - Receipt, allocation and reporting to the AF of financial resources - Allocate and monitor Annual Spending Limits based on agreed work plans; - Oversight and monitoring of AF funds; - Return unspent funds to AF. 	US\$ 285,000
Project monitoring and reporting	<ul style="list-style-type: none"> - Provide technical support in preparing TOR and verify expertise for technical positions involving in the monitoring and reporting; - Provide technical monitoring, progress monitoring, validation and quality assurance; - Receives and analyzes the monthly report from the PMU on the subproject ESIA implementation - Conduct field monitoring missions to verify the concrete implementation of the ESMP including integrated pest and pesticides management and recommend specific corrective actions to ensure that the subprojects complies with the E&S principles of the Adaptation Fund; - Monitor the implementation of the agreement of compliant resolution; - Verify the implementation of adaptation actions planned under the project; - Submit annually to the Adaptation Fund, the report on the status of implementation of subprojects ESMP. 	US\$ 105,000
Project evaluation and reporting	<ul style="list-style-type: none"> - Provide technical support in preparing TOR and verify expertise for technical positions involving evaluation and reporting; - Conduct the evaluation field missions on the different aspects of the project namely: technical, environmental, social, pest and pesticides management, grievance management, budget, etc.; 	US\$ 118,000

Step	Indicatives services	Indicative cost
	<ul style="list-style-type: none"> - Include in the midterm and final evaluation report of the project, the status of implementation of the environmental and social management plans of the subprojects; - Participate in briefing / debriefing; - Verify technical validity / match with AF expectations of all evaluation and other reports; - Undertake technical analysis, validate results, and compile lessons; - Disseminate technical findings. 	
TOTAL		US\$ 781,000

Project Budget for the Adaptation Fund

The project will be fully funded by the Adaptation Fund. However, the taxes are supported by the Bissau-Guinean State. The following table presents the budget of the Adaptation Fund.

Table 30: Adaptation Fund summary budget

COMPONENT	Total HT (X 1000 USD)	Taxes (1000 USD)	Total TTC (X 1000 USD)
Component 1: Development of technical and institutional capacity to address increasing climatic risk in adaptation practices and planning	700	133	833
1.1. Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning	242,5	46,075	288,575
1.2. Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning	457,5	86,925	544,425
Component 2: Enhance the resilience of existing agricultural productive systems, including water control	7550	1434,5	8984,5
2.1: Agricultural activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security	7550	1434,5	8984,5
Component 3: Knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning	150	28,5	178,5
3.1: Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries level	150	28,5	178,5
Component 4: Project execution cost	798	51	949
4.1. Investiment	13	21	134
4.2 Recurent cost	723	18	741
4.3. Monitoring and Evaluation	62	12	74
BASIC COST	9 198	1 647	10 945
Project/Programme Cycle Management Fee charged by the Implementing Entity	781		781

TOTAL PROJECT	9 979	1 647	11 726
----------------------	--------------	--------------	---------------

The detail budget of Adaptation Funds for each component is presented in the following table (see column colored in green). In fact, the project has three main components, plus the project management component.

Component 1: Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning

Activities	Unity	Total Quantity	Unit cost	Basic cost planning (X 1000 USD)					Total (USD)		
				year 1	year 2	year 3	year 4	year 5	HT Adaptation Fund	Tax (Government Bissau-Guinéen)	TTC
1.1. Technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions enhanced											
1.1.1. Socio-climatic vulnerability assessment for East Guinea-Bissau	Nbre	1	20,0	20,00	0,00	0,00	0,00	0,00	20,00	3,80	23,80
1.1.2. Assessment of technical capacity building needs of ministries and field operatives for adaptation planning	Nbre	1	10,0	10,00	0,00	0,00	0,00	0,00	10,00	1,90	11,90
1.1.3. Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources											
Formulation of detailed intervention plan for pilot climate-smart agriculture actions	Nbre	1	10,0	0,00	10,00	0,00	0,00	0,00	10,00	1,90	11,90
Enhancing policies, procedures and guidelines of the country through integration of issues related to climate change, gender and natural resources sustainable management	FF	1	150,00	37,50	75,00	18,75	18,75	0,00	150,00	28,50	178,50
Development of a monitoring and evaluation system	FF	1	12,50	12,5	0,00	0,00	0,00	0,00	12,5	2,375	14,875
Sub-Total 1.1.				80,00	85,00	18,75	18,75	0,00	202,50	38,48	240,98
1.2. Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning											
1.2.1. Technical trainings on adaptive systems including integrated pests and pesticides management and organizational capacity built for NGOs, identified target groups and technical services	FF		50,00	27,50	7,50	7,50	7,50	0,00	50,00	9,50	59,50
1.2.2. Technical assistance and rural extension for subprojects	Nb of sites	99	1,00	33,00	33,00	33,00	0,00	0,00	99,00	18,81	117,81
1.2.3. Formulation/update of contingency plans for climate-risk management	FF	1	5,00	5,00	0,00	0,00	0,00	0,00	5,00	0,95	5,95
1.2.4. Support for farmers groups for adaptation actions implementation and integrated pest and pesticides management, tools box design, dissemination and appropriate use											
Support for farmers groups by the government technical experts	FF	5	15,00	15,00	15,00	15,00	15,00	15,00	75,00	14,25	89,25
Proximity support by sites facilitators/animators	H/M	810	0,12	10,80	21,60	21,60	21,60	21,60	97,20	18,47	115,67
Design, dissemination and appropriate use of integrated pest and pesticides management tools box	FF		30,00	30,00	0,00	0,00	0,00	0,00	30,00	5,70	35,70
1.2.5. Capacity building to prevent forest fires											
Capacity building and operationalization of fire brigades	FF	5	25,00	25,00	25,00	25,00	25,00	25,00	125,00	23,75	148,75
Enhancing technical and organizational capacities of Rural Climate Change Forum (RCCF) and Environmental Vigilance Committees (CRA) for better operationalization	FF	4	4,08	4,08	4,08	4,08	4,08	0,00	16,30	3,10	19,40
Sub-Total 1.2.				150,38	106,18	106,18	73,18	61,60	497,50	94,53	592,03
TOTAL 1				230,38	191,18	124,93	91,93	61,60	700,00	133,00	833,00

Component 2: Enhance the resilience of existing agricultural productive systems, including water control

Topics	Unity	Cost per unit HT (X1000 USD)	Basic cost (1000 USD)					TOTAL (1000 USD)		
			Year 1	Year 2	Year 3	Year 4	Year 5	HT (Adaptation Fund)	Tax (Government Guinea Bissau)	TTC
2.1: Agricultural activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security										
2.1.0 Support for subproject selection and design										
2.1.0.1 Support for subproject selection										
2.1.0.2. Complementary studies of APD, Subprojects ESIA realization, ESMP updated, DAO, supervision and control of works										
2.1.1: Development of lowlands to maintain agricultural production in drought periods										
2.1.1.1. Development of lowlands in the framework of the adaptation fund projects										
2.1.1.2. Scaling up of partially developed sites within the old LDCF project										
2.1.2: Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply										
2.1.2.1. Construction of micro-dams with the irrigation systems										
2.1.3. Rehabilitation/improvement of soil productivity and small-scale investments into agriculture inputs, machinery and tools										
2.1.3.1. Sensitization/Education about the harms of slash and burn agriculture practice on soil fertility and crop yields and dissemination and strengthening of climate-smart agriculture practices										
Sensitization/Educatin about the harms of slash and burn agriculture practice on soil fertility and crop yields										
Dissemination and strengthening of climate-smart agriculture practices										
2.1.3.2. Support access to improved seeds, resistant and short cycle										
Support to groups for the acquisition and multiplication of quality seeds										
Construction of seed banks										
2.1.3.3. Support to groups for the acquisition of quality fertilizers, pesticides and crops conservation										
2.1.3.4. Support for the adaptation of the cultural calendar to climate disturbances										
Installation of 120 rain gauges (pluviometers)										

Topics	Unity	Cost per unit HT (X1000 USD)	Basic cost (1000 USD)					TOTAL (1000 USD)		
			Year 1	Year 2	Year 3	Year 4	Year 5	HT (Adaptation Fund)	Tax (Government Guinea Bissau)	TTC
Support of meteorological services to farmers groups for better adaptation of agriculture to climate disturbances	FF	5	5	5	5	5	5	25	4,75	29,75
2.1.3.5. Support for plowing and the acquisition of equipment /materials for the production and valorization of products on a demonstrative basis	—									
Support to groups for clearing and plowing sites	ha	0,1	0	20	80	0	0	100	19	119
Support for the acquisition of power tillers (motor cultivators)	Nb	10	0	200	0	0	0	200	38	238
Support for the acquisition of weeders	Nb	0,01	0	10	0	0	0	10	1,9	11,9
Support for agropastoralists for the harnessing of oxen for plowing and crops transporting	Nb	4	0	240	0	0	0	240	45,6	285,6
Support for the acquisition of dehullers	Nb	7,2	144	0	0	0	144	288	54,72	342,72
2.1.3.6. Support for the production of forage for livestock (Cultivation of brachiaria, moringa, fruit trees, etc.) and increase organic manure production	—									
Support for the acquisition of brachiaria seed and others nutritive seed and cultivation for the production of forage	ha	0,05	5	10	10	10	15	50	9,5	59,5
Construction of hangars for feed storing	Nbre	0,2	3	10	7	0	0	20	3,8	23,8
Support for the specialization of breeding groups in the production of brachiaria seeds	FF	10	0	10	10	0	0	20	3,8	23,8
Support to the prevention of livestock diseases through vaccination	FF	15	0	15	0	15	0	30	5,7	35,7
Promotion of the production of organic manure	unity of 50 ha	2	0	10	30	0	0	40	7,6	47,6
2.1.3.7. Support for the analysis of soil and water quality and subprojects ESMP monitoring										
Support for the analysis of soil and water quality	FF	70	70	3,5	3,5	3,5	3,5	84	15,96	99,96
ESMP monitoring	FF	12	12	12	12	12	12	60	11,4	71,4

Project Funds (X 1000 USD)	2891	4578	840	384	505	9198
Implementing Entity Fee (X 1000 USD)	143	140	200	190	108	781
Total (X 1000 USD)	3034	4718	1040	574	613	9979

Table 32: Schedule for implementation of the project

TOPICS	Years					
	1	2	3	4	5	6
Component 1: Development of technical and institutional capacity to address increasing climatic risk in adaptation practices and planning						
Outcome 1.1. Technical capacity of government and field workers to assess impacts, vulnerability and adaptation needs in extremely vulnerable regions enhanced						
Output 1.1.1. Socio-climatic vulnerability assessment for East Guinea-Bissau						
Output 1.1.2. Assessment of technical capacity building needs of ministries and field operatives for adaptation planning						
Output 1.1.3. Formulation of detailed intervention plan for pilot climate-smart agriculture actions and policies, procedures and guidelines related to climate change, gender and natural resources						
Outcome 1.2. Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, environmental, social and gender in practice (on-site) and adaptation planning						
Output 1.2.1 T Technical, organizational capacity building for ONGs and identified target groups						
Output 1.2.2 Technical assistance and rural extension for subprojects						
Output 1.2.3 Formulation/Update of contingency plans for climate-risk management						
Output 1.2.4 Support for famers groups by the government technical experts for adaptation actions implementation						
Output 1.2.5 Capacity building to prevent forest fires						
Component 2: Enhance the resilience of existing agricultural productive systems, including water control						
Outcome 2.1. Agricultural and livestock activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security						
Output 2.1.1 Development of lowlands to maintain agricultural production in drought periods						
Output 2.1.2 Construction of micro-dams for irrigation of rice, vegetable crops and livestock water supply						

TOPICS	Years					
	1	2	3	4	5	6
Output 2.1.3 Rehabilitation/improvement of soil and pasture productivity and small-scale investments into agriculture inputs, machinery and tools						
Output 2.1.4 Construction of drills/wells and ramps for improved livestock and domestic water supply and market gardens development						
Componet 3: Knowledge management of lessons learned on climate-smart agriculture and adaptation planning						
Outcome 3.1 Sustainable climate-smart agriculture practices and management is adopted in comparable regions of the country, and disseminated to other West African countries, contributing to resilience and development needs in those regions						
Output 3.1.1. Developement of knowledge management strategy						
Output 3.1.2. Creation and animation of project						
Output 3.1.3. Development of manual and other materials on best practices and measures for climate-smart agriculture						
Output 3.1.4. Dissemination of results to other regions of Guinea-Bissau and West Africa						

FINANCING PLAN

The project financing plan is as follows:

Table 33: Adaptation Fund disbursement plan

COMPONENT	TOTAL HT (1000 USD)	An 1	An 2	An 3	An 4	An 5
Component 1. Development of technical and institutional capacity to address increasing climatic risk in adaptation practices and planning	700	230,375	191,175	124,925	91,925	61,6
1.1. Development of technical and institutional capacity to address the increase of climate risk with the adaptation practices and planning	202,5	80,00	85,00	18,75	18,75	0,00
1.2. Farmers groups, private professionals of development, associations and government experts have integrated knowledge on climate-smart agriculture, in practice (on-site) and adaptation planning	497,5	150,38	106,18	106,18	73,18	61,60
Component 2: Enhance the resilience of existing agricultural productive systems, including water control	7550	2317	4523	475	55,5	179,5
2.1: Agricultural activities are climate-smart and contribute to sustainable increases in productivity and enhance national food security	7550	2317	4523	475	55,5	179,5
Component 3: Knowledge dissemination of lessons learned on climate-smart agriculture and adaptation planning	150	5	33,25	13,25	49,25	49,25
3.1: Sustainable climate-smart agriculture practices and management is disseminated in comparable regions of the country and other West African countries level	150	5,00	33,25	13,25	49,25	49,25

4.1. Investisment	12,60	12,60	0,00	0,00	0,00	0,00
4.2 Recurent cost	723,4	142,70	145,15	145,19	145,19	145,17
4.3. Monitoring and Evaluation	62	15,40	5,40	17,40	5,40	18,40
BASIC COST Adaptation Funds	9198	2723,075	4897,975	775,765	347,265	453,92
Project/Programme Cycle Management Fee charged by the Implementing Entity	781					
TOTAL Adaptation Funds	9979	2723,075	4897,975	775,765	347,265	453,92

Considering that the roads are very bad, it is paramount to put at the disposal of the PMU, four-wheel vehicles to ensure that the project can be successfully managed. Knowing that, the Adaptation Fund can't finance the vehicle acquisition, the implementation Entity (BOAD) will provide a grant of 100 000 USD to Guinea Bissau to finance two new four-wheel vehicles for 90 000 USD and 10 000 USD to rehabilitate the two LDCF project vehicles. The table below presents the disbursement plan of the BOAD.

Table 34: BOAD disbursement plan

COMPONENT	TOTAL HT (1000 USD)	An 1	An 2	An 3	An 4	An 5
Component 4: Project execution cost						
Acquisition of vehicles	90	90				
Rehabilitation of the LDCF Project vehicles	10	10				
Total BOAD	100					

PART IV: ENDORSEMENT BY GOVERNMENT AND CERTIFICATION BY THE IMPLEMENTING ENTITY

A. Record of endorsement on behalf of the government³¹ *Provide the name and position of the government official and indicate date of endorsement. If this is a regional project/programme, list the endorsing officials all the participating countries. The endorsement letter(s) should be attached as an annex to the project/programme proposal. Please attach the endorsement letter(s) with this template; add as many participating governments if a regional project/programme:*

Mr. Viriato Luis Soares Cassama National Program of Climate Change Ministry of Environment and Sustainable Development Tel: +245 96 678 40 46 Email: Cassamavilus@gmail.com	Date: September, 4 th , 2017
---	---

B. Implementing Entity certification *Provide the name and signature of the Implementing Entity Coordinator and the date of signature. Provide also the project/programme contact person's name, telephone number and email address*

I certify that this proposal has been prepared in accordance with guidelines provided by the Adaptation Fund Board, and prevailing National Development and Adaptation Plans (The National Communication to the UNFCCC, the National Adaptation Programme of Action (NAPA), the National Poverty Reduction Strategy Paper (PRSP) The Nationally Determined Contributions (NDC)) and subject to the approval by the Adaptation Fund Board, <u>commit to implementing the project/programme in compliance with the Environmental and Social Policy of the Adaptation Fund</u> and on the understanding that the Implementing Entity will be fully (legally and financially) responsible for the implementation of this project/programme.	
MBENGUE Almamy 	
Implementing Entity Coordinator - BOAD	
Date: September, 4 th , 2017;	Tel. and email: Tel: +228 99 86 86 60 / 22 23 25 24 Email: ambengue@boad.org
Project Contact Person: AMEGADJE Mawuli Komi	
Tel. And Email: Tel: +228 90 04 62 54 Email: mawulikomi@yahoo.fr	

⁶ Each Party shall designate and communicate to the secretariat the authority that will endorse on behalf of the national government the projects and programmes proposed by the implementing entities.

ANNEX

Annex list

- Annex 1: Letter of endorsement
- Annex 2: Certificate of Environmental Compliance
- Annex 3: Report on lessons learned
- Annex 4: Potential sites identification report
- Annex 5: Procedures to resolve a grievance in the framework of the project
- Annex 6: List of public consultation during PCN preparation
- Annex 7: List of public consultation during potential sites identification
- Annex 8: List of public consultation during lessons learned study
 - Annex 8.1: Public consultation at village level during the lessons learned study
 - Annex 8.2: List of the meeting with technical services involves in the LDCF project in Gabù
 - Annex 8.3: List of the meeting with UNDP in Bissau
- Annex 9 : List of public consultation during Full project preparation
 - Annex 9.1. : List of public consultation with Gabù and Bafatà populations during Full project preparation
 - Annex 9.2: List of the meeting with technical services involves in project in Gabù
 - Annex 9.3. List of the meeting with technical services involves in project in Bafatà
 - Annex 9.4. Meeting with fire control comity of Mampuro
 - Annex 9.5. Meeting with the comunautary forest control comity of Madina Djalocunda
- Annex 10: List of participants of Environmental and Social Management Framework (ESMF) validation workshop
- Annex 11: List of participants of Full project validation workshop
- Annex 12: Lei n°5/98 de 23 de Abril (Law on the land use in Guinea Bissau).
- Annex 13: Project operating account tables
- Annex 14: Terms of reference (competencies and composition) of the Regional planning office.
- Annex 15 : Action plan for integrated pests and pesticides management

Annex 1: Letter of endorsement

Letter of Endorsement by Government
Government of Guinea Bissau

Bissau, 16th August, 2017

To : The Adaptation Fund Board
C/o Adaptation Fund Board Secretariat
Email: Secretariat@Adaptation-Fund.org
Fax: 202 522 3240/5

Subject: Endorsement for Project "Scaling up climate-smart agriculture in East Guinea Bissau".

In my capacity as Designated Authority for the Adaptation Fund in Guinea Bissau, I confirm that the above project proposal is in accordance with the Government's national priorities in implementing adaptation activities to reduce adverse impacts of, and risks, posed by climate change in Guinea Bissau.

Accordingly, I am pleased to endorse the above project proposal with support from the Adaptation Fund. If approved, the project will be implemented by Banque Ouest Africaine de Développement (BOAD) and executed by General Directorate of Environment/ State Secretariat of Environment of Guinea Bissau.

Sincerely.

Mr. Viriato Luis SOARES CASSAMA
National Designated Authority (NDA)

REPÚBLICA DA GUINÉ-BISSAU
SECRETARIA DE ESTADO DO AMBIENTE
O SECRETÁRIO DE ESTADO

DECLARAÇÃO DE CONFORMIDADE AMBIENTAL

DCA N°006/SEA/2016

O Secretário de Estado do Ambiente enquanto Autoridade Ambiental Competente e no uso das suas competências atribuídas pela Lei n° 10/2010 de 24 de Setembro no seu artigo 45° alínea b, conjugado com o artigo 27°, número 2, concede a presente Declaração, que aprova a viabilidade sócio ambiental do projeto de forma condicionada, a favor da Direcção Geral do Ambiente para implementação do “Projeto de Agricultura Inteligente no Leste da Guiné-Bissau, sito na Região de Gabu, concretamente nos Sectores de Pitche (Bucuré Boboti, Copiro e Sago/Fulamori), Sector de Pirada (Soncocumba, Sissaucumba, Durabali e Sambataco), Sector de Gabu (Cumpaghor e Bada) e Sonaco (Colicunda) e Região de Bafatá, concretamente nos Sectores de Contuboel (Madina Sara, Manatu Mansona, Calugada, Sanecumba e Suna Nhamabé) e Sector de Ganadu (Cuncana, Pacua e Cantacunda)”.

Por ter reunidas as condições dispostas no número 1, do Artigo 32° da Lei supra citada, esta Declaração constitui a expressão formal do reconhecimento pelo cumprimento das Políticas de Salvaguarda Ambiental e Social.

Por ser verdade, lhe foi outorgada a presente Declaração, assinada por mim e autenticada com carimbo á óleo em uso nesta Instituição.

Bissau, 12 de Dezembro de 2016

ACKNOWLEDGMENTS

The consultant would like to acknowledge and thank all who graciously shared their time, information, and inputs for the interviews and consultations that took place as part of this study. In particular, he would like to thank Eng. Variato Cassama (national coordinator of the Resilience Project), Mr. Mr. Dauda Sau (UNDP CO Programme officer), Dr. Lourenço Vaz, Mr. Casimiro Sanca and Mr. Garcia Embaló from SEAT/DGE for their valuable time and support during this study, and Mr. Benjamin Djabare and Mr. Mangla Nantchia for their important contributions to this report.

1. INTRODUCTION

1.1 Context

The West African Development Bank (BOAD) submitted the project idea “Scaling up climate-smart agriculture in East Guinea Bissau” (GNB/RIE/Agri/2015/1) to the Adaptation Fund Board Secretariat, on behalf of the Secretariat of State for Environment and Sustainable Development of Guinea-Bissau (SEAT/DGA) as national executing agency. The project concept note (PCN) was accepted for Full Proposal Development by the Fund’s Secretariat in March 2016.

The PCN proposes to intensify the activities of the GEF / UNDP Fund for the Least Developed Countries (LDCF) Project entitled "Strengthening Climate Change Adaptation and Resilience in the Agrarian and Water Resources Sectors in Guinea-Bissau" (00077229) - in short resilience or LDCD project - to further promote integration of adaptation into development planning and build institutional capacity for climate risk planning in the country. Between April 2011 (signature of contract) and now the Resilience Project had initiated climate-smart agriculture pilot projects in 14 tabancas in the eastern savannah regions of the Gabú ‘region’. The new project is aiming towards solidification and expansion of those experiences. This upscaling process refers to new activities in both the 14 original tabancas of the ongoing LDCF project and an additional ~26 tabancas in the ‘regions’ of Gabú and Bafatá, with total beneficiary target population for the new project foreseen at approximately 37,000 people in East Guinea-Bissau.

In this context, a problem encountered during the PCN review process was the lack of identified lessons learned and best practices from the LDCF project (e.g. effectiveness and efficiency of organizational structures, or of technological choices in the field), and how these could support the new project.

It can be understood, in part, based on the observation that the LDCF project is still under development, with finalization foreseen for the end of this year, making it impossible for the project proponent to refer to its main achievements comprehensively, or explain how the proposed project would build on it. However, “lessons identifying lessons on strengths or weaknesses in preparation, design, and implementation that affect performance, outcome, and impact” (OECD, 2002) provide an opportunity to avoid past mistakes and improve performance of the new project. This includes lessons learned both about procedural activities (especially project and financial management) and project activities at national (capacity building and policy integration) and local level (climate-smart agriculture subproject implementation).

The present report contributes to closing this knowledge gap.

1.2 Purposes of the study

The objective of this study is to identify and analyze the relevant lessons learned from the GEF/UNDP LDCF “Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau” (00077229) project implementation, in order to support the Full Proposal development of the “Scaling up climate-smart agriculture

in East Guinea Bissau” (GNB/RIE/Agri/2015/1).

Specifically, this report aims to respond to these two questions raised by PCN reviewers of the Adaptation Fund Secretariat:

- Question 1: What have been the main achievements of the LDCF funded project at the end of the project, and has its implementation has resulted in opportunities to achieve higher cost-efficiency in the investments in the proposed project; and
- Question 2: How will the project make use of the lessons learned and best practices from the LDCF project?

Within the context of these questions, the lessons learned include the “identification and analysis of constraints, opportunities, and approaches to be considered for the new Adaptation Fund Full Project, focusing on all relevant aspects (technical, environmental and social, organizational, institutional, legal, financial, etc.) that enabled the implementation of project activities and the achievement of the expected results under the LDCF project” (translation from TOR by author).

Furthermore included are descriptions of best practices for adaptation to climate change in the Gabú LDCF project region, focusing on projects that have proven their adaptability to adverse effects of climate change and climate variability, soil management and appropriate management of pesticides.

1.3 Scope and methodology

This study on lessons learned is undertaken in support of the Full Proposal development of the project “Scaling up climate-smart agriculture in East Guinea Bissau” (GNB/RIE/Agri/2015/1). This report aims to answer the two questions posed in section 1.2. It does neither constitute a final evaluation of the LDCF project nor a M&E report of climate-smart agriculture projects, and therefore does not give a complete validation of the project’s development strategy or its intervention logic (UNDP, 2009). Instead, this study can be seen as a rapid assessment of the LDCF project, based on a review of the project documents made available, a limited number of semi-structured interviews with the project team, and participant observation in short field visits.

Under the term ‘lessons learned’ this report understands ‘Generalizations based on evaluation experiences with projects, programs, or policies that abstract from the specific circumstances to broader situations, [which] frequently, lessons highlight strengths or weaknesses in preparation, design, and implementation that affect performance, outcome, and impact’ (OECD, 2002).

Particular focus of this report is on responding to these two questions: (1) what worked in the project; and (2) what could be improved in the project. These questions are responded to both in terms of project design and formulation and at the project implementation level.

In order to organize the research for this report a simple matrix was developed to methodologically assess the relevant information pertaining to lessons learned:

- Left column: slightly adapted set of research questions from the LDCF project's mid-term evaluation (Quese and Jandi, 2013) that inquire about the most relevant results and lessons learned in terms of project design and formulation and at the implementation level;
- Middle column: the most recent status of the LDCF project pertaining to the particular research question or set of research questions; and
- Right column: summary of lessons learned and best practices regarding to the particular research question/set of research questions and based on the observation of the actual status of the project in relation those same questions, and how lessons could contribute to the new Adaptation Fund project.

This work was divided into two distinct parts: (i) a five-day visit to Guinea-Bissau for data collection and interviews, with four days in the capital Bissau and a one-day Gabú field visit (20–24 June 2016); and (ii) five days for writing up of results into a report and revisions. During his stay in Guinea-Bissau the consultant met with the relevant institutions involved in the implementation of the LDCF project in the capital of Bissau, the Project management unit (PMU) members at Gabù, and beneficiaries at project implementation level in Gabú region. Field trips were organized by Global Lead together with LDCF project coordination. Additional data collection and analysis with project target group and LDCF project was carried out in order to complement information received during two earlier missions to Guinea-Bissau in 2015 (July 2015, and November 2015 by Global Lead). The semi-structured interviews in Bissau and Gabú were held in Portuguese where possible, and carried out with help of translators in Gabú where local dialects were spoken.

Two important limitations restrict the drawing of lessons learned from the ongoing LDCF project:

1. Access to information: internal project documents of the LDCF project – annual technical and financial reports, project memos, other – could not be consulted for the identification of lessons learned, given restrictions by UNDP Guinea-Bissau (LDCF implementation agency) regarding the dissemination of these documents (information provided by LDCF project coordinator Mr. Viriato Cassama, on 21 June 2016).
2. Data availability: up to date not comprehensive Vulnerability Reduction Assessment (VRA) (see LDCF PRODOC) has been undertaken to understand the contributions of the small-scale project interventions at local scale to climate change adaptation, including the identification of possible best practices for adaptation, their adaptability to adverse effects of climate change and climate variability, soil management and appropriate management of pesticides. Therefore, the identification of best practices for adaptation to climate change at the *project implementation level* in the Gabú 'region' is limited. To cope with this limitation, Global Lead did preliminary work with members of project management unit and the beneficiaries to have the key results of LDCF project. This report is drafted in Portuguese to be sure that it is very comprehensive for the Bissau Guinean. The report in Portuguese is attached to the present report (see annex 1).

2. BRIEF PRESENTATION OF INTERVENTIONS: PROJECT AND DEVELOPMENT CONTEXT

The “Strengthening adaptive capacity and resilience to Climate Change in the Agrarian and Water Resources Sectors in Guinea-Bissau” – or short Resilience Project – is an ongoing initiative of the Government of Guinea-Bissau, with support from UNDP and the Global Environment Fund’s (GEF) Least Developed Countries Fund (LDCF), at a total volume of US\$ 4.200.000. Project duration was originally set from 2011 to 2015, but a no-cost extension has been granted and project termination is now foreseen of end of 2016.

Its overarching objective is to *support the country’s water and agricultural sectors in becoming more ‘resilient’ to current climatic variability and longer term climate change impacts*, with measures and activities aimed at (i) integrating adaptation needs and climate risk into key national policies, plans and programs, in order to allow for integrated water and agrarian resource management under climatic change; (ii) implementation of cost-effective small-scale adaptation interventions targeted at family farmers located in 14 tabancas of the country’s eastern savannah Gabú ‘region’, in the ‘sectors’ Pitche and Pirada (each 7 tabancas) which suffer from increasing drought and flood risk, particularly related to improved water and drought management, and increasing productivity and income in agriculture (seed banks, bio-fertilizer, diversified planting techniques, wider market access etc.) and livestock raising (smaller livestock keeping, reducing water-related conflict, construction of wells, etc.) via participatory trainings and technology deployments; and (iii) dissemination of lessons learned and best practices from activities into national plans and policies, including the development of a Rural Climate Change Forum (RCCF) and establishment of a basis for the replication of all site level activities in the future (PRODOC, 2011).

In this, the Project uses the term ‘resilience’ as creating ‘resistance to shocks and stresses’ and ‘developing sets of skills and behaviors needed to overcome challenges by both anticipated and unanticipated climate-induced stresses’ (PRODOC, p. 41). This puts emphasis on technological modernization of smallholder agriculture and livestock raising in the region, but importantly also and capacity building measures, particularly investments into social and human capital for project beneficiaries, from local to institutional to systemic levels. The project intervention logic is summarized in Box 1.

In this context, the Resilience Project has been developed in hindsight of removing these barriers that impede successful resilience building:

1. Key stakeholders have limited capacity to plan and respond to climate change risk and to incorporate adaptation measures in the conceptualization and implementation of development frameworks;
2. Limited capacities at local intervention level to implement new measures and utilize improved technologies in agriculture and water resource management, increasing vulnerability of already vulnerable communities as a result of climate change; and
3. Climate change risk analysis in Guinea-Bissau is still at very early stages and poorly quantified at a significant scale, both spatially and temporally. Furthermore, information is not widely available that would encourage a shift away from the ‘reactive & ad hoc’ climate change response paradigm towards more ‘anticipatory & deliberative’ practices (PRODOC, 2011).

Box 1: Intervention logic of LDCS project

First, the project's beneficiary communities will have greater knowledge and understanding of climate issues. They will have access to improved information on future climate predictions tailored to their needs, and will be able to interpret this information practically to help them make decisions relating to their own livelihoods. Secondly, stakeholders at the local level will correspondingly be able to apply improved practices with respect to water and agricultural resource management: practices that will be particularly useful in the context of a changing climate. These include examples of: water conservation techniques, water management, improved livestock management and livestock choices, more appropriate, resilient crops and cropping techniques, appropriate agroforestry techniques, improved seed banks, crop storage and protection, and safety nets and stimulation of livelihood diversification through micro-grant schemes and other group activities. Thirdly, an essential corollary to these schemes is a supportive and enlightened institutional environment. Finally, by project completion, critical capacity will have been created through training and developing a strong cadre of national experts and advocates – people who understand the climate stakes for Guinea-Bissau's future and can continually influence policy development processes. Considerable amounts of finance are expected in the future relating to climate change in Africa. Thus it is essential that Guinea-Bissau has the national capacity to obtain, absorb and distribute funds and investment for their greatest effect in ensuring food and water security for its people. With this longer-term perspective in mind, capacity development on climate change will provide significant ongoing benefits for the nation. The project will consistently invest in documenting information, analysis, experiences and lessons, particularly those lessons that will be extracted 'on-the-ground' from site-level implementation, as well as directly investing in capacity building and training. This will ensure the dissemination of knowledge, practices and project results to a wide range of audiences.

Source: PRODOC (2011).

Key institutional partners in the project are NGOs, public sectors and private entities, especially related to the knowledge and technology transfers in agrarian and water sectors.

3. ACHIEVEMENTS AND WEAKNESSES OF THE PROJECT APPROACHES: KEY FINDINGS AND LESSONS LEARNED

The following matrix summarizes the identified key findings from the interim review of the LDCF project: first regarding program design and implementation, and secondly, at the implementation level. These lessons learned will be implemented concretely should the current proposal be accepted for funding.

Research question	Lesson(s) learned	
	LDCF project context and outcomes	Best practices proposed for the new project
	<u>What has worked and What could be improved?</u>	
3.1 Program design and formulation		
3.1.1 Quality and pertinence of the project process formulation		
<p>3.1.1.1. Is the project's logical framework sufficiently clear and appropriate, including indicators with baseline and target values, and have activities and products of the project been clearly related to the impacts of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> The project mid-term evaluation noted that the project's logical framework was, in general, well designed. This included clearly defined institutional mechanisms and a logical theory of change that are reflected in the project's three outputs: (i) integration of adaptation and climate risk into national policies and plans; (ii) implementation of cost-effective small-scale adaptation interventions at local level; and (iii) dissemination of lessons learned; which in return support the overarching project objective. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> It is unclear if the field interventions linked to the logical framework (e.g., building of small dams, dissemination of organic fertilizer, creation of contingency plans) in isolation and without market development are sufficient to support resilience building at local level, or is they would fit under a general climate-smart agriculture framework (see questions 8-10). It is also unclear if conservation and sustainable resources use activities of the LDCF project fit the logical framework. (For more information see questions 8-10 below). Several PRODOC project <i>objective level</i> and <i>outcome level</i> indicators were not considered SMART (specific, 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> A new project can rely on the existing logical framework and theory of change (see question 10.2). Field intervention activities should be enhanced in an updated logical framework. This is discussed in detail under questions 8-10. Project intervention logic with regards to capacity building through climate-smart agriculture should be better integrated and more substantial at local level. UNDP or FAO or experiences from community-based adaptation networks could provide substantial input to these measures (see more question 9). Also biodiversity services need to be considered to a larger degree. Project indicators for the Adaptation Fund project proposal need to be designed more carefully in order allow for consistent M&E of the project. The mid-term evaluation has given examples for changing indicators of the LDCF project (p. 10-11). These changes are relatively easy to implement.

	<p>measurable, achievable, relevant and time-bound). An example: <i>objective level indicator 2</i> (“Government budget and international funding allocated to managing climate change risks increased”) was not formulated as an indicator, but as an effect, and was thus considered unspecific. As a consequence this indicator could not be reasonably measured in the LDCF project, compromising M&E efforts in the project.</p>	
<p>3.1.1.2. Are project activities and expected outputs and outcomes, as defined in the Project Document (PRODOC), relevant to the needs and priorities expressed by the beneficiaries of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Institutions and experts interviewed during the mid-term evaluation confirmed that project activities, expected outputs and outcomes are relevant to the needs and priorities of the beneficiaries. It was specifically noted that planned project activities were aligned with women’s needs. The review of literature undertaken for PCN development further highlighted this observation. LDCF project activities addressed key vulnerabilities in agriculture and water resources management, and thus contributed to immediate and longer-term development and resilience needs of extremely vulnerable farmers. As such, the project was in line with the recommendations of the UNFCCC Nairobi Work Programme and the best available scientific evidence on climate change impacts, vulnerability and adaptation in agriculture, water resources as well as food security. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • Those work activities and expected outputs of the LDCF project that focus on field interventions for smallholder farmers and extremely vulnerable groups (elderly, women, etc.) provide a sound basis for developing the new project’s logical framework and intervention logic. (Suggestions for improving the intervention logic are presented in questions 8-10 below.)
<p>3.1.1.3. Was project formulation conducted in a timely fashion?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Project formulation was considered timely. Start of the project was delayed by the coup d’état in 2012 and small delays in the contracting between the Guinea-Bissau and UNDP. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • Minor delays at project start affected some field 	<ul style="list-style-type: none"> • The possible linkages and interactions with other projects or programs should be realistically assessed at project start in order have a clear picture of what these initiatives can provide to the new Adaptation Fund project, and what not. Such an assessment may reduce possible conflicts at the beginning of the project.

	<p>activities. For example, it was assumed that the UNDP Community-Based-Organizations' Support Project in Gabú Region (OCB) and the African Development Bank project PRESAR would support quality seeds to the LDCF project. But these projects were already ending their activities during initialization of the LDCF project, and therefore seeds could no longer be supplied.</p>	
<p>3.1.2 Project relevance to the political context of Guinea-Bissau</p>		
<p>3.1.2.1. Are the project and its activities aligned with national priorities?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> The project supports relevant government policies and plans including the Poverty Reduction Strategy (2011-2015) and NAPA priorities, as well as priorities of other ministries and agencies, such as those of the General Directorates of Water Resources, Agriculture or Livestock. Partnership protocols signed during LDCF project implementation highlight common objectives and possibilities for collaboration clearly. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> The identification of project initiatives outside government may have been insufficient, as this has been highlighted during the review process by the Adaptation Fund. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> A thorough identification of relevant projects in the project area should be undertaken in order to identify overlaps and possibilities for collaboration. This has been done already during Project Concept Note development. This includes partners that are not directly involved in the project activities and to other initiatives that may occur in the area new Adaptation Fund project, as well as strengthening partnerships with other interventions that may occur in the same areas as the Adaptation Fund project, and which could complement the activities initiated by the new project (see also recommendations #14 and #16 of mid-term evaluation). The Intended Nationally Determined Contributions (INDC) may be taken into account the new project
<p>3.1.3 Status of risks and assumptions formulated in the PRODOC</p>		
<p>3.1.3.1. Were the assumptions and risks identified during project formulation relevant and clearly in the project identification sheet and the project document?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> In general assumptions and risks identified in the PRODOC were relevant and clearly identified. Two identified risks (“bad financial management and corruption undermines project development” and “exclusive focus on climatic change reduces interest of 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Identified risks and risk hypotheses were relevant and clearly identified. Therefore, the new Adaptation Fund project could rely on updated risk hypotheses based on LDCF project assumptions. Updated risk hypotheses for the Adaptation Fund

	<p>target group”) did not materialize during the project.</p> <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • Not all difficulties that eventually arose during LDCF project development were initially anticipated in the PRODOC (see questions 3.2 and 3.3 below). These included (i) in part ineffective participations by key policy stakeholders, for example, DG Agriculture in Gabú (Report Mangla), and despite signed MOU with SEAT; and (ii) in part difficulties with NGO, especially regarding community mobilization and non-payment to local personnel. 	<p>project should take into account the learning on risks from the LDCF project. These alterations are easy to implement for the project entities and may improve overall managerial capacity of project team, including adaptive management.</p>
<p>3.1.3.2. Were risks and assumptions always validated and did new risks appear throughout the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Risk validation was undertaken by the project team throughout the project. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • Throughout the project risk validation seems to have been carried out on an ad-hoc basis with no continuous risk assessment, such as recommended by the mid-term evaluation team (see question 3.3.), although those new risks do not seem to affected overall project outputs. For example, two coup d'états in April 2012 and 2015 led to partial embargos to the country, including restrictions on financial resources, but still the project seems to have continued quite firmly in developing its activities. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • Based on the review of the project documents and interviews it does not seem that risk appreciation and validation was insufficient to cause serious problems for LDCF project development.
<p>3.1.3.3. Has a risk management system been implemented? And did this work when new risks appeared?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • In general new risks did not affect project development: next to political uncertainty (see question 3.2) problems arose in a partnership with one nat'l NGO, whose contract with the project had to canceled just a few months into the project due to a lack of managerial 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • The project managed to maintain operations despite difficult political situations and other emerging risks. This indicates that political risks were sufficiently anticipated, and that risk management was appropriate under the circumstances.

	<p>capacity and possible misuse of allocated funds. (For example, local community mobilizers were paid, but did not show up for work.) As a consequence the project team diversified partnerships with NGOs/CBOs in order to guarantee sustainability of interventions at local community level. These examples show that that the project management unit was able to react to new risks, also taking potentially unpopular measures.</p> <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • Continuous risk assessment: As of December 2013, no system for risk management was set up for the LDCF Project. On this basis the mid-term evaluation suggested to incorporate a risk assessment matrix in the quarterly and annual reports and complete Risk Log systematically on an annual basis during the preparation of PIR (Project Implementation Report). • A risk not anticipated was inaction on behalf of other project partners at the policy level, despite signing of MOU, affecting particularly planned water infrastructure works of the project which were essential for community resilience building. However, it is unclear how this negative development affected the effectiveness of adaptation interventions at the community level – given the lack of an effective M&E for field interventions (see question 1.1). 	<ul style="list-style-type: none"> • In the current political and institutional context of Guinea-Bissau risks should be systematically identified and assessed according to type (environmental, financial, operational, political, regulatory or policy), level (standard or critical), the response category (emergency plan, monitoring or other) and changes in risk (mitigated, stable, increasing, problem) and date of risk identification. Risk hypotheses with regards to political risk will need to be developed with care, given the continuing political instability in the country. • Following the recommendations of the LDCF project mid-term evaluation, it is suggested that a continuous risk assessment system should be implemented. Risks should be presented annually in the PIR (Program Implementation Report) through a risk assessment matrix, including possible (alternative) mitigation actions. The project will aim to implement a continuous risk assessment should the Adaptation Fund decide to fund this PCN. In tri-semester reports risk evaluation matrix should be incorporated, according to type (environmental, financial, operational, political, regulatory or strategic), level (low, medium, critical), type of response (emergency actions, change in plans, other) and evolution of risks (stable, declining, increasing, etc.), and date of risk; also using the annual project report to give a more complete picture on risks and their development. Although staff has attended several courses, some additional needs are felt by the technical staff of the project team in terms of capacity building. Should current workload of the project team not permit these activities it is further suggested that the project hires a
--	--	---

		<p>consultant for supporting the project management unit, which could also improve building capacities in adaptive management in the project.</p>
<p>3.1.4. Project management structures and contribution to effective and efficient project development</p>		
<p>3.1.4.1. Are annual work plans coherent and of good quality?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> PTAs (Annual Work Plan) were judged to be of good quality, according to the mid-term evaluation. (This author did not have access to these reports which are internal to the project management unit and UNDP.) <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> Submission of plans was sometimes delayed, causing several delays in project development. The LDCF project is implemented on the basis of PTA (Annual Work Plan) and quarterly programs. PTAs require validation from the Project Steering Committee (PSC) for implementation to proceed. This has caused several problems: difficulty to gather PSC members (consisting of representatives of key institutions, beneficiaries and local and regional authorities), lack of interest of the parties concerned, and frequent changes in the institutions that make up the PSC. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Following the mid-term evaluation team suggestions it is suggested that PTAs should be submitted earlier, and also discussed in advance with the Project's steering committee. Development and submission of status reports: necessary to allow for early validation, thus enabling provision of funds and start of activities early in the year. This particularly includes putting into place annual procurement plans which detail purchases and can speed up administrative and financial procedures. For this the Project Management Unit personnel for the Adaptation Fund project should be recruited by call of application, to be trained on fiduciary, environment and social standards.
<p>3.1.4.2. Has governance of the project been effective and did it provide sufficient strategic directions to project development?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> In general governance of the project been effective and did provide sufficient strategic directions to project development. This included a project steering committee (PSC) including participants from civil society and key line ministries. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> The PSC did not have the role laid out in the PRODOC 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> The overall governance structures of the project should be improved, in order to strengthen overall effectiveness and strategical guidance for the project. The Project Steering Committee (PSC) should contribute to the submission of status and other reports through continuous monitoring and more frequent meetings. The interim report specifically calls for a strengthening of participatory and consultative

	<p>regarding LDCD project implementation and strategic guidance. Meetings were infrequent and key stakeholders did not participate or participate unfrequently.</p> <ul style="list-style-type: none"> • In general, the project team consisted of experienced and committed people, but their dispersion created for communication and project activity planning. The training of the project team in specific areas should receive more attention from the start of the project to allow better serve beneficiaries. • Int'l experts to support the project development were not always hired as planned, or did not contribute to the project as planned when hired. For example, the CTP recruited to fulfill overall a leading function in the project was incapable to support the project team, including lack of Portuguese and French language knowledge. • Governance of the ground team was hampered, as the ground team had no official responsible for ensuring coordination and liaison with other local actors. Communication problems arose also as local partners did not interact with local staff, but spoke directly with Bissau. The local project team in Gabú did not have a responsible coordinator, nor sufficient financial means to assure coordination and collaboration with other local interventions. Overall conditions improved during LDCF project development, but similar errors may occur in case of a Bafatá office. • Financial resources for Bissau and field staff in Gabú were often insufficient to implement work activities given bureaucracy linked to procurement processes and other. In direct response a project account was opened in 2013 in order to allow SEAT to access funds for the trimester and facilitate quick payments. But contrary to 	<p>mechanisms in this respect, which the project team should strive to realize under a new project.</p> <ul style="list-style-type: none"> • Given the complexities of the LDCF project (and the complexities of the new project, which will likely invest in more integrated mitigation and adaptation interventions) it will be important to invest into training and new motivated staff. One option to increase staff capacity would be to look for young Guinea-Bissau experts with university degree and curricula in adaptation project management and development that are currently localized outside the country, and aim to bring these people back to the country via the project. This motivated staff personnel could increase the project impact of the new project. Strong international contacts of LDCF project coordination may support this. • International consultants could help in increasing the performance of the project team, even if hired for short periods of time. However, the hiring process of int'l specialists should be reassessed and undertaken with strict rules. It is suggested that UNDP in Guinea-Bissau supports the hiring process of a new Adaptation Fund process, and that the consultants hired stay in Bissau with the project team in the office, especially in the case of long-term specialists. • Local staff needs to have resources to be able to allow them keep up administrative management and technical activities in a satisfactory manner, with stringent financial management in place. The mid-term evaluation suggested an annual procurement plan which details planned purchases to speed up the administrative and financial procedures is a good idea to facilitate payments. Other mechanisms to facilitate
--	---	--

	<p>what had been expected, the making of payments continued to take much time, and many activities could have been terminated earlier if it weren't for the lack of resources. Transport possibilities (including 4x4) were limited for project development.</p> <ul style="list-style-type: none"> Capacity building of the local team should receive specific attention: it was planned to contract specialists in specific knowledge areas, such as adaptation, agronomy, agro-pastoral systems, community development, climate information etc., but hiring did not occur. 	<p>payments should be discussed with the Adaptation Fund and other partners at the beginning of the project. It would be an idea to think now about procurement plans could be developed jointly in order to reduce delays and problems. It is likely that the project donor office needs to provide support/facilitate and better administrative and financial procedures for this. In this the project team could be act quicker and be more proactive (pp. 19-20).</p>
<p>3.2 Implementation level</p>		
<p>3.2.1 Functionality of project partnerships established</p>		
<p>3.2.1.1. To what degree have partnerships realized for project development been established with relevant stakeholders active in the country and region targeted by the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> The LDCF project established relevant partnerships with national partners (through six partnership protocols) and regional and local government. Further partnerships were established with nat'l and local NGOs. In general, these partnerships were effective and helped project development. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> Despite successful signing of partnerships agreement the outcomes of these agreements were not always realized. As mentioned above, in one case a contracted NGO did not deliver the contracted services, and thus had its contract terminated. In other cases the power of the project team is more limited: in case of the six partnership protocols not all partners did engage as promised, e.g. affected the delivery of water works in the project region. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Existing partnerships with NGOs should be maintained and strengthened, and partnerships with CBOs should be broadened in the new project in order to ensure sustainability and a more effective replication and diffusion of activities and results.
<p>3.2.1.2. To what degree do</p>	<p><u>What has worked:</u></p>	<p><u>Lessons learned:</u></p>

<p>national, regional and local government institutions participate actively in the project implementation? To what degree are other institutions (other than government) participating in the project?</p>	<ul style="list-style-type: none"> Local and regional government institutions participated in the project, leading to the Gabú Region Development Plan and similar plans for Pitche and Pirada sectors. In general these plans establish important connections between water and agricultural sector development and climate change adaptation. Further important regional and local contributions were harnessed through the implementation of the Rural Climate Change Forum (RCCF) which consists of relevant stakeholders, including particularly vulnerable groups such as elderly and women. Strategic partnerships were strengthened through project contributions to the Carta de Política de Desenvolvimento Rural (CPDA), Programa de Investimento Agrícola (PNIA), Plano de Desenvolvimento da Pecuária, Esquema Diretor de Água e Saneamento, Documento de Estratégia Nacional de Luta Contra a Pobreza (DENARP), Plano de Desenvolvimento Regional de Gabu (PDR), Plano de Desenvolvimento Local de Setor de Pitche and the Plano de Desenvolvimento Local de Setor de Pirada. These collaborations were done via workshops with active participation from key line ministries, including also the Ministérios de Interior (Serviço de Proteção Civil, and also Finanças (Alfândegas)). <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> The signing of partnership protocols did not always result in concrete action by partners. This was attributed to the political instability in the country and frequent changes in key ministerial positions of partner institutions. As such, some partnerships left to be desired, for example the DG Agriculture and Water 	<ul style="list-style-type: none"> Social mobilization – The RCCF has been very important for this kind of mobilization, it has been an ‘open school’, a very efficient mechanism, and the new Adaptation Fund project should invest in this forum also for the Bafatá region, as well as build capacity at the local tabanca level. The project should aim to extend and strengthen partnerships with CBOs to ensure durability and more effective dissemination and replication of activities and effects of the LDCF project, which is also to be followed in a possible Adaptation Project. Problems of forest fires - vigilance committees first attempt to stop this; but the project did not accompany these committees very well, and voluntarism has cooled off significantly again. These committees will likely need more supervision and contributions from the local project staff – which probably requires the development of a strategy. Ways to turn partnerships and partnership protocols more effective should be discussed with partners, e.g. through budget support, stronger control, or re-strengthening of Project Steering Committee which has been used unfrequently. Participating NGOs should provide work and financial plans, use bookkeeping and undergo monitoring and evaluation (M&E), including financial monitoring – experiences from German Liaison Office in Guinea-Bissau with NGOs and small-scale project development shows very little project failure (1 project of ~50 projects a total failure), showing the capacity and success of these approaches for small-scale project development in the country. Furthermore, the mid-term evaluation suggested to maintain existing
---	--	---

	<p>Works Agency do not deliver, negatively affecting project implementation.</p> <ul style="list-style-type: none"> Integration of community-based organizations (CBOs) could have been more pronounced: CBO engagement has been found limited due to organizational weaknesses of these bodies (see also question 2). An example is the participation of environmental vigilance committees which started off well, but later saw a drop in participation and motivation. As a result, illegal hunting or slash-and-burn agriculture may have continued in the region where the role of the environmental vigilance committees was to contribute to reducing these. On the side, it has to be considered that, in general, the process with NGOs and rural technicians has been very good and essential; about 85%-90% of planned deliverables were achieved, which is a very relevant figure. Strategic partnerships and documents were not well disseminated to core users, which would be necessary to reinforce capacity building in resilience and adaptive capacity in the agriculture and water sectors at the policy level. 	<p>partnerships with NGOs and to define, in a consultative manner with NGOs partners, and with the support from the UNDP monitoring and evaluation service, a tool for monitoring their performance in terms of mobilization in the villages. Where collaborations worked out fine, it was found that the contracts between project team and NGOs/CBOs had well defined plans and responsibilities. Otherwise, training and using dedicated staff for NGO/CBO engagement maybe a good idea.</p> <ul style="list-style-type: none"> Work with NGOs will require strict supervision, both in technical and financial terms. NGOs should submit technical and financial plans for each subproject, to be approved by Bissau or local office. Also expenses need to be verifiable and verified by Bissau (using nota fiscal). Experience with other projects in the country (including by the German Government – mentioned in the point above) show that project failure this way can be minimized significantly.
<p>3.2.2 Adequacy of monitoring and evaluation mechanisms</p>		
<p>3.2.2.1. A monitoring and evaluation plan containing SMART indicators has been set up and assessments are conducted during the implementation of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> Monitoring and evaluation indicators were identified in the PRODOC initially, and then reviewed at project inception stage. This start-up workshop was welcomed by stakeholders and helped provide project information to partners and stakeholders, to clarify certain activities and certain indicators. <p><u>What could be improved:</u></p>	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> The PRODOC foresaw a VRA – Vulnerability Reduction Assessment – as key indicator, but no baseline has been established in the LDCF project. As mentioned already, the lack of capacity to show impact will have direct consequences on leveraging additional finance in the future, and also leaves doubts regarding the impact and cost-effectiveness of measures. In this context SMART indicators and reference/baseline values are particularly relevant to measure project

	<ul style="list-style-type: none"> • No M&E plan seems to have been developed, despite being planned for in the 2013 PTA. This has turned the assessment of effectiveness of measures and activities very difficult. In addition, project M&E indicators were not consistently SMART, and baselines were not established for any indicator (see 1.1.). • Furthermore, until 2013 (mid-term evaluation) the project management team lacked clear procedures on including the frequency of data collection missions, sharing responsibility for collecting data for each indicator, identification and capitalization of best practices, etc. In response, UNDP held two training workshops in results-based management monitoring which allowed for correction of some flaws in information production and evaluation process. However, the training does not seem to have been followed up with practical responses in M&E activities and planning (2014, 2015 and 2016). • Important: For <i>objective level indicator 3</i> (“Scores of UNDP’s Vulnerability Reduction Assessment (VRA) to be applied upon inception, mid-term and end-of-project in project-site communities”) neither a baseline was defined at project start, nor a follow-up monitoring was undertaken. In this context existing reporting procedures on productivity increases, participation in events, etc. were judged to be inadequate as an indicator for impact of field interventions. As a consequence, the contribution of the project to local (community) vulnerability reduction is currently difficult to qualify and quantify, and this will likely affect capacity to obtain further financing in the future. (The lack of M&E efforts and lessons learned has been criticized strongly by the reviewer of the current Adaptation Fund PCN.) 	<p>success of climate-smart agriculture interventions. These will include measuring increases in productivity, resilience (adaptation), reduction or removal of greenhouse gases (GHG) (mitigation), and enhancing achievement of national food security and development goals.</p> <ul style="list-style-type: none"> • Hiring of a dedicated int'l consultant/team of consultants to develop project baseline and methodology for subproject vulnerability impact assessment at the beginning of the Adaptation Fund project is one option, especially those which have experience in community-based adaptation (CBA) or ecosystem-based adaptation (EBA). Another option could be collaborations with universities/research institutes which could do M&E at low cost and provide research assistant help to carry out field work during project. This cooperation should also include UNDP Guinea-Bissau as a key supporting actor.
--	---	---

<p>3.2.2.2. Have M&E results been utilized for adaptive management of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> No consolidated M&E system has been installed in the project, but project coordination submitted annual and trimestral reports in which issues pertaining to project operational planning, steering, management of processes, learning and strategy design were discussed. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> The mid-term evaluation noted that report submitted lacked clarity, with a focus on presentation of data on results and outputs, but not adaptive management. In turn, adaptive management of the project might have benefitted from a more systematic reporting on steering, management of processes, learning and strategy design issues. However, it is unclear if a stringent M&E system might have been implemented by the project team with current resources – with the project team already engaged in many activities and otherwise limited resources. Nevertheless, use of adaptive management is a process that should be strengthened during project development, but may require support from outside consultants and/or UNDP. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> A new project under the Adaptation Fund should invest strongly into a consolidated M&E system for the project, in order to facilitate adaptive management. Strengthening capacities in this regard will likely have benefits for overall project coordination.
<p>3.2.2.3. Are stakeholders being consulted in the implementation?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> The RCCF regularly brought together different stakeholders active in the region, enhancing the dialogue between these stakeholders around the aspects of climate change and emergency response. The level of involvement of different line ministries was judged positive, especially where MOUs were signed. Communities, including women, were involved and consulted in all activities implemented. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Institutional communication and collaboration with institutional partners should be strengthened. This is with regards to Partnership Protocols and their implementation (see above).

	<p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • The communication, collaboration and dissemination of information with institutional partners which are not directly involved in the implementation of project was judged inadequate by some project partners, and could be strengthened to maximize overall project outreach. 	
<p>3.2.2.4. Equity issues and gender equality are taken into account and included in the implementation of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Gender and equity dimensions have been incorporated into project activities relatively strong. Women and women's groups are well integrated at local level, having benefitted capacity building courses on different agricultural technologies, water management, health and animal feed (women's participation in these courses ranges from 30% to 50%). Specifically the project encourages women's participation in the context of male-dominated rural communities, and disseminates project activities specifically focused at women (e.g., horticulture and gardening in which men show little interest in the project region). In some outputs produced by the project, such as contingency plans, there are sections showing the conversations and needs identified specifically by women in preparation of project activities. • Gender and equity concerns have also been integrated into the project's communication strategy, where climate change is discussed in linkages to human and women's rights, women's participation, AIDS, biodiversity, etc. are clearly integrated. Community radio programs support this outreach strategy. Functional alphabetization manuals now also integrate this knowledge, based on a MOU with the Instituto Nacional de Desenvolvimento da Educação (INDE). The project thus also contributes to cultural change in the country. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • The new project should make efforts to better communicate links between discussions with women, their opinions, the activities developed together with them and possible outcomes, and the evaluation by women. Gender aspects should specifically also be incorporated into the M&E system. • Gender sensitivity of community forest protection should be studied more closely, given that male household members are largely responsible for slash-and-burn agriculture. • Initial vulnerability assessment is necessary in order to identify vulnerable community groups.

	<p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • The documentation of the project impact on equity and gender issues is insufficient, which can be linked to lacking M&E efforts and baselines in the project (see 1.1, 6.4.). • In some cases the benefits of gender were not fully realized, e.g. regarding biodiversity conservation and environmental services it is often the male members of a household that deforest and do slash-and-burn agriculture, and strategies should be specifically designed to address this problem. • Not in all cases the most vulnerable populations were really addressed (some populations were not really the most vulnerable). • The current project team seems to have few female members, and no direct gender specialist. 	
<p>3.2.3 Effectiveness of project implementation</p>		
<p>3.2.3.1. What has been the progress in achieving the objectives and effects of the project so far?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Overall, activities and capacity building will contribute to realization of three work packages. Project activities seem to have been carried out in a relatively satisfactory manner. In the following a short summary of achieved outputs is presented. Due to the lack of M&E activities the results here presented can only be quantitative in nature, but not qualitative. Results are taken directly from LDCF project reports, or based on participant observation and/or interview data: • Outcome 1 ('Climate change risks and adaptation measures integrated into key national policies, plans and programs for integrated water, agriculture and livestock management'): relatively successful at 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • The construction of water infrastructure needs to start early in the project. It is only that way that farmers can learn to use and maintain more complex 'hard' infrastructure during project execution, with almost immediate benefits for households, agriculture and livestock. In the current LDCF project, seemingly due to operational rather than technical problems, small dams and wells are only implemented this year, implying there is (i) no direct connection to the already developed field work and (ii) no way for famers to learn use this infrastructure as the LDCF project will terminate end of this year – this would, however, change if a new project, e.g. through the Adaptation

	<p>regional and local level, e.g. through the integration of climate change concerns into the Regional Development Plan of the Region Gabú and local development plans of Pirada and Pitche. At national level climate change is now part of country plans to reduce poverty, and partnership protocols with relevant partners have been signed.</p> <ul style="list-style-type: none"> • Outcome 2 ('Small and medium scale climate change adaptation practices for water, agriculture and livestock management are demonstrated and implemented in selected sectors'): numerous field interventions developed at community-scale with focus on capacity building, including training on climate-resilient agricultural practices (crop rotation, terracing, intercropping, conservation of water and soils, etc.), introduction of rice short-cycle varieties, introduction of forage crop for animal consumption, installation of demonstration fields, building of veterinary pharmacies, introduction of improved poultry, goat and sheep breeds (more resilient to heat stress), creation of cereal banks, implementation of seed banks, construction of waterholes and wells, contingency plans against flooding in villages, among other. • Outcome 3 ('Lessons learned and best practices from pilot activities are disseminated and integrated in national plans and policies'): knowledge and institutional capacity has been strengthened, e.g. via technical and human resources capacity building of the National Institute of Meteorology, or the elaboration of an agro-climatic vulnerability maps for the Gabú region, as a direct result of identified knowledge gaps. <p><u>What could be improved:</u></p>	<p>Fund, will commence, building upon the LDCF outputs.</p>
--	---	---

	<ul style="list-style-type: none"> • Water infrastructure needs to be better integrated into the subproject development at village level. This is discussed more below. • As noted above, it is unclear if subproject activities contribute to resilience building – given that no baseline has been established and no systematic M&E undertaken, the contribution those activities have for family farmers cannot be clearly analyzed and affirmed. • A related point to the subproject activities is that, albeit having a focus on agricultural practices, livelihood, and contingency plans, overall vulnerability reduction may be limited as activities have been implemented largely in a dispersed manner, without a clear commercialization strategy/market model or water supply measures. This point is further discussed below. 	
<p>3.2.3.2. Has the project followed its guidelines and relevant procedures for implementation?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • In general the LDCF project seems to have followed its guidelines and procedures, yes, although management decisions seem to have been based more on ad-hoc decisions than on adaptive management. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • A lack of guidelines seems to exist regarding communication between project team units in Bissau and in the field, but also regarding communication with other partners. For example, on several occasions local project partners such as NGOs contacted Bissau directly to resolve issues, although communication should have been directly with the local Gabú personnel. This may have created frictions and undermined authority of the local team. The new project would likely benefit from investments into better internal communication procedures and organization of the 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • Communication channels and procedures should be strengthened in a new project, e.g. setting key times and rules for communication, bringing local teams to meetings in the capital and vice versa. . Furthermore, communication structure in possible Gabú and Bafatá stations should be strengthened, including internet access. Assigning a field coordinator (not existent in ongoing LDCF project) may also be necessary to fully coordinate field interventions. • Mechanisms should be sought to make other functional structures, in order that the Comitê Inter-Ministerial para o Ambiente, Comitê para as Alterações Climáticas, and the Comitê Diretiva do Projeto (CDP) can contribute to the efficiency and effectiveness of the project. These organs are even more important given that other such as composed of senior government officials (Ministers and Secretaries

	<p>team.</p> <ul style="list-style-type: none"> • Participation of project steering committee and other organs was insufficient (see above). • Distances of participating communities one to another in the Project were high, although the PRODOC clearly stated this should not happen in the project to avoid high costs. This should be avoided in a new project. 	<p>of State, etc.) do not always contribute fully due to political instability, or lack of time or interest. Building and supporting these intermediate structures may have great benefits for the project.</p> <ul style="list-style-type: none"> • In the Adaptation Fund project currently developed care should be taken to assure that villages are relatively close to each other in order to maximize impact and reduce cost for the project.
<p>3.2.4 Cost-effectiveness relationship of project in terms of time and budget</p>		
<p>3.2.4.1. What is the level of achievement in terms of outputs and outcomes in light of the investments undertaken, and, specifically, are the small-scale interventions cost-efficient?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Overall cost-effectiveness has been judged positively in mid-term evaluation, despite low overall density of subprojects in the field. Spending of resources has, in general, occurred according to the project's financial plan, although political interferences at times affected spending. Overall, there is little evidence that outputs could have been achieved with fewer financial resources. No newer information has been obtained which would contradict the information gathered from the mid-term evaluation. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • It has been noted that investments into water infrastructure (wells, small dams, etc.) were mostly started in the project's final year. This may have negatively affected the results from disseminating climate-resilient agricultural practices, e.g. crop rotation, conservation of water and soils, terracing or intercropping as agricultural activities in the region rely fundamentally on water supply. As such the contributions of the field interventions to agricultural production, and as such also farmer income, may have been more limited. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • As mentioned the project started with activities that absorb less funds such as awareness raising or training, both prerequisites for laying the foundations for subproject execution. These activities could be carried out simultaneously with the procedures for preparation for the construction of infrastructures given that those take a longer time to construct. This would allow that project processes are finalized early and that water supply can support climate-smart agriculture activities in the project.

<p>3.2.4.2. Is the project complementary to other active interventions in the project region?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> In general, the project is complementary to ongoing initiatives in the target region. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> Despite complementarity interactions with existing projects seems to have been relatively low, and in other cases possible connections to relevant projects in the target region (esp. those with environmental focus) had not been identified. This shortcoming has been mentioned in the Adaptation Fund reviews of the PCN. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> It is important that connections to complementary projects in the target region are identified clearly, and that communication is established with those projects already in the development phase of the project. (Observation: relevant programs and projects have been identified in pre-proposal, and are listed in Annex B of this document.)
<p>3.2.5 Project contribution to building of adaptive capacities of the beneficiaries</p>		
<p>3.2.5.1. Are the targeted beneficiaries being reached?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> Through focus group meetings, collection of testimonies during the mid-term evaluation, and participant observation, it can be affirmed that the targeted population has been reached by the project, in general. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> Distances between the tabancas and bad road conditions were not taken sufficiently into consideration from a project operational perspective. This reduced the number of beneficiaries that could be effectively covered by the project due to low population densities in most tabancas. Furthermore, in several cases it was noted after start of subproject activities that beneficiary vulnerability was lower than originally believed – in other words, they should not have been chosen as beneficiary as they were not eligible. In those cases the originally targeted population was not reached as planned. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Beneficiary selection should be based on stringent criteria to avoid mis-selection of ineligible candidates for subprojects. This will be relatively easy to implement, and probably will only amount to a more stringent application of existing selection criteria used for the LDCF project. Already known: higher population densities in tabancas and more resources will permit a larger beneficiary population. This can be identified at project beginning, but should always consider the selection criteria above.
<p>3.2.5.2. To what degree has the project contributed to improving</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> Implementation of a number of small and medium scale 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> It is recommended to allocate more resources to field

<p>the resilience of local communities?</p>	<p>climate change adaptation practices and infrastructure for water, agriculture and livestock management in 14 tabancas of the project region, including capacity building of farmers in best agricultural practices (crop rotation, seed production), forage production, dissemination of quality seeds, creation of seed banks, but also contingency plans, use of climate information and alphabetization programs, among other. Based on information from the project team especially forage production (brachiaria, or signalgrass) and no-tillage agriculture are working, with positive effects on income generation and food production. Brachiaria is a particular success case, as it has expanded to over 80 tabancas. It is a genus of plants in the grass family native to tropical and subtropical regions of Africa, with excellent growing conditions in savannah landscapes and some semi-arid lands. Brachiaria can be used cultivated as forage, as done in LDCF project, and it is the opinion of the project team that this contributing to livelihoods of cattle raisers in the region. This is also very clear from project reports, according to project team.</p> <ul style="list-style-type: none"> • Food stocks and feed stocks were not directly requested by farmers but nevertheless seem to support resilience building. <p><u>What could be improved:</u></p> <ul style="list-style-type: none"> • Vulnerability reduction of family farmers in project region is addressed through mainly building capacity in water resources and agriculture management at project-level and through strengthening institutions to integrate climate change into their planning. The following observations relevant to increasing the outputs from 	<p>interventions. This is already addressed. Allocate more resources to field interventions. This is already addressed: the Adaptation Project concept note foresees investments in the amount of US\$ 7 55 million for this project component, including investments in capacity building of fire brigades to prevent project fires (project component 1).</p> <ul style="list-style-type: none"> • Overall the LDCF project is focusing a lot of water interventions that need government support. The LDCF project are relevant in this regard, may do not provide the necessary adaptive capacity building component required for climate adaptation given its lack of market development strategy, and integrated system development at community level. Decentralized water supply, for example through rooftop rainwater harvesting or other methods, could improve food and nutrition security if used in community gardens or individual gardens during longer time of the years. Cisterns would turn communities less dependent on uncertain government interventions (for example, in one case a deep well has already installed nearby the village of Benfica during a road construction project, but after workers left this well was not kept up for community – decentralized water access avoids these kind of problems). • Food stocks and feed stocks are also important for family farmers, although communities initially did not directly request this activity as it is a new concept for family farmers in the region. These storage capacities are also relevant for seeds and tools. • Hydrological infrastructure will likely have substantial impacts, including on family farmer income, but this is yet not possible to see because infrastructure hasn't
---	--	---

	<p>these activities can be made:</p> <ul style="list-style-type: none"> - Quality seed dissemination of dry cereals needs to be better disseminated and used, especially horse corn seeds, which are most popular with farmers in the region; - Farmers should have incentives to practice cultivation of cash crops, including cotton and sesame. This is yet limited in the project region, also due to lack of purchasing power in the region and lack of adequate market structures; - Improve agro-forestry-pastoral production in the project region, including through capacity building. This is especially important as cashew-nut dependence together with declining prices have led to manifestation of poverty traps, affecting not only negatively farmer income and food security, but leading also to deforestation in the region; - Building hydraulic infrastructure (mini-dams and rainwater retention basins) aimed at collecting and storing rainwater for irrigation and livestock, and focus also on household water access through rooftop rainwater harvesting, a very effective 'social technology' utilized in dry regions in NE Brazil. Such 'soft' adaptation infrastructure can complement 'hard' investments such as dams, and can support irrigated agriculture (with clear gender benefits, and mostly women work in gardens, next to food security and income increases) through drip irrigation systems, for example; - Raise more awareness in communities, especially of women, as regards to the practice of horticulture together water from wells or boreholes constructed to maximize their use, as well as other – cheaper – rainwater harvesting methods. The integration with the 	<p>been implemented. Linking agriculture and livestock activities with the infrastructure will be very important to leverage those benefits. Water works need to be built at beginning of project – not at end. This way the clear potential of water infrastructure in the field interventions was not capitalized upon. In ongoing project – also due mismatch in project planning which included lack of commitment from other national agencies – these activities were only recently begun, so that no real impact can be felt in the field until now. On any account, increasing water stress due to climate change will require strong investments reduce hydrological deficits in the region.</p> <ul style="list-style-type: none"> • Contingency plans: could go further. In some cases, such as Benfica, existing plan inadequate or ineffective to reduce harm from floods – material was bought, but rock formation near topsoil leads to flooding from belowground in the tabanca, and not from nearby rivers. Tabancas likely will require more help to address these problems than thus have a few tools and an idea where to go to when the flood arrives – risk for houses to collapse continues. • Activities to reduce slash-and-burn agriculture and forest fires should be integrated into the project. The new project should address this via (i) organizing rural fire brigades, (ii) training them to combat forest fires that endanger agricultural production and biodiversity in the project region, (iii) provide them with tools to do so, (iv) sensitize fire brigades on good practices to avoid fire, and (v) train fire brigades to sensitize rural populations before any drought season on fire risks and good practices to avoid them. Forest fires should also be covered by the project's contingency plans for
--	---	---

	<p>water infrastructure, in general, has been low as most investments were only to be carried out in 2016 – with decentralized rainwater harvesting water access would have likely been assured earlier as construction is easier and does not depend on motivation of partner institutions or complex engineering interventions;</p> <ul style="list-style-type: none"> - Encourage communities to increase grain production and consequently crop diversification, and increase of area under cultivation. • It was noted that field interventions respond only in part to community needs because local needs for vulnerability reduction are very numerous and because available resources for field interventions in the project are limited (US\$ 632.000). A direct consequence was that in order to benefit all 14 participating tabancas only few interventions could be implemented in each tabanca. • The review process of the Adaptation Fund project made clear that there is a need to focus on reducing slash-and-burn agriculture and forest fires. These activities were not comprehensively integrated in the LDCF project. Erosion protection and soil compaction are important environmental side in the project region, but were not adequately addressed. This leads to the assumption that the social impact may have been larger than the environmental benefit. Regarding resilience it will be important to consider environmental aspects of subproject development – not only social impacts matter. For example, uncontrolled forest fires are a threat to forests and socioeconomic activities. Each year thousands of hectares are being destroyed because of uncontrolled slash-and-burn agriculture, which later are occupied by cashew nut monoculture at 	<p>climate risk management.</p> <ul style="list-style-type: none"> • Continue outreach efforts in agricultural techniques, livestock and water management improved distributed in the villages, in order to limit the risk of non-ownership communities of these techniques and to promote greater ownership. • The mid-term evaluation (Quesne and Jandi, 2013) and scientific evidence on livelihoods and socio-climatic vulnerability (Eakin et al., 2014; Porter et al., 2014) clearly point out that vulnerability reduction for poor dryland farmers will rely on project-scale interventions (capacity building and technology access) together with broader interventions in political institutions, health, education and infrastructure. While these were beyond the scope of the original LDCF project – and would continue to be beyond the scope of the current project proposal – starting discussions and aligning strategies between different institutional partners is a way forward. As a consequence, the LDCF project signed six (6) partnership protocols with relevant institutional partners in the areas of water resources management, small infrastructure, environmental and livestock and agriculture in order to increase integration of strategies. The new project should invest heavily in increasing these partnerships as well as building new partnerships in the areas of health or education in order to support vulnerability reduction in a more integrated approach. • The LDCF project originally did not focus on performance criteria in the partnership agreements signed with NGOs and project providers as studios proximity monitoring could compel the partners and recipients of implementation of the project to the
--	---	--

	<p>the detriment of crops for food security and biodiversity.</p> <ul style="list-style-type: none"> • A literacy program was started in most tabancas, seeing that access to education is a key factor for adaptation, with participation particularly strong from women. One of the aspects that could be improved is the selection of teachers, which in some cases did have difficulty to grasp the content of the training manuals and transmit their content to their students. This is partly due to the fact that teachers were chosen from local literacy teachers, with the intention of minimizing costs, however, at the detriment of quality. Maintaining quality standards will be essential to make alphabetization a success. • Seed distribution and information campaign: while farmers benefited from training, these activities were not regularly followed by INPA in their activities because of the institutions non-inclusion in the program budget for this activity. Due to this many farmers continue to use their usual seeds, or are not prepared to buy quality seeds if they are not subsidized. • Lack of interest of some communities in technologies due to perceived lack of climatic risk (p. 13 Mangla). • Limited reach of several community radios and constant technical problems, particularly during rainy season, affect the project's outreach strategy. 	<p>objectives that were assigned to them. Monitoring of pilot project activities had also not begun at the time of the mid-term evaluation so that changes in food security and access to safe drinking water could not be assessed (Quesne and Jandi, 2013). In order to measure the impact of the project on livelihoods and climate change vulnerability and increase efficiency and effectiveness of the program the new project should therefore include a stronger monitoring and evaluation system.</p>
<p>3.2.5.3. What is the likelihood of achieving the expected impacts?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> • Overall likelihood seems high – although this document is unable to assess this given lack of information and analysis. But take into account limited money available for field interventions, lack of market integration/broader approaches, and lack of M&E. <p><u>What could be improved:</u></p>	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> • Only few funding was available for on the ground measures, so that impacts in terms of adaptive capacity and resilience building necessarily had to be limited. Increased budget for on the ground activities in new project (US\$ 7.8 million) will help to increase project impact at local level.

	<ul style="list-style-type: none"> In cases of some subprojects, the project team observed a certain drop in animation after ending of the interventions. Part of the reason is that local government was unable to give further support to those subprojects either materially or financially. In those cases subproject may not be sustainably in the long term. 	
3.2.6 Sustainability of activities and the impacts achieved by the project, and replication potential		
<p>3.2.6.1. What is the level of local ownership?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> In general, project ownership seems high. Communities are involved in all activities, either directly or represented through the RCCF or Environmental Vigilance Committees (CRA). Furthermore local communities were involved in the project design and seeking of solutions from the beginning of the LDCF project. This has been confirmed by the project’s mid-term evaluation and reports by the project team. It was not possible to confirm project ownership during the field visit for this report given that most interventions were utilized given actual drought conditions in the region – a problem which had been experienced also in 2015. <p><u>What can be improved:</u></p> <ul style="list-style-type: none"> Active participation of beneficiaries and communities was low on occasions: Although beneficiaries show that they are aware of climate change and the need to take measures to reduce its negative effects, ownership and adoption of technological innovations is quite weak, especially among men. Surprisingly this was also noted in meetings to plan water supply and use frameworks in some tabancas, where it would seem that water access is pivotal to climate change adaptation in the region. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> It is unclear what has led to low participation and ownership in the cases here presented. One reason could be badly planned or unannounced meetings, lack of knowledge in participatory planning methods or unmotivated personnel which is not willing to use such methods, or cultural barriers which cannot be easily deciphered. Hiring quality personnel, especially young motivated technicians for field and Bissau stations, may support an ownership building process. Working with specialists from different areas, including community development, environmental education, adaptation, anthropology and community facilitators, with strong knowledge in interdisciplinary approaches may benefit not only local mobilization, but also overall project outcomes.

<p>3.2.6.2. Have any efforts been made to review and publish the lessons learned from the implementation of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> The project led the development of a comprehensive communications strategy, conducted numerous outreach and communications activities at the base and has set up some institutional communication tools (website, community radio, Facebook page, project newsletter). Currently the internet site for knowledge dissemination is a bit out of date in terms of information and also design. <p><u>What can be improved:</u></p> <ul style="list-style-type: none"> Given the lack of continuous M&E efforts most information provided through the project cannot yet be categorized in terms of lessons learned. This is problematic particularly when aiming to disseminate and scale-up technologies for climate-smart agriculture approaches as there are no information on their effectiveness in reducing vulnerability. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Elaborate communication strategies may contribute to raising interest to the case of Guinea-Bissau, especially in the international climate finance context. Building a strategy to access these potential funds may be a good way to support future project development in the country. Systematic M&E will be an essential support to achieve this objective.
<p>3.2.6.3. Do project effects present a potential for replication?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> Mid-term evaluation suggested to develop an accurate replication strategy (Recommendation #16). The project had not developed a document on good practices and lessons learned from the LDCF project, in part undertaken in this report. The LDCF project is a pioneer project that strongly invests in capacity building of family farmer to build resilience against adverse climatic change, using both immediate and long-term adaptation measures in development policies, plans, programs, projects and actions. Through outputs organized in three work packages/outcome indicators, the project addressed key vulnerabilities in agriculture and water resources management in one of the most affected regions of 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> It is suggested that a replication strategy should be developed on basis of the existing logical framework and theory of change, including the work activities of the LDCF project. New planned work packages taking into consideration the necessity of upscaling. Effective climate adaptation will require on a significant upscaling of current outreach and knowledge dissemination as through the LDCF project (a) many tabancas in the project region were not covered and (b) in some participating tabancas adoption of new technologies and practices was still low in 2013. Continued focus on Guinea-Bissau's dry East regions the project is expected help reach a critical mass that

	<p>Guinea-Bissau, and thus contributed to immediate and longer-term development and resilience building of extremely vulnerable farmers, with a particular focus on extremely vulnerable groups: women, elderly and children. However, the LDCF has limited scope in terms of particularly regarding (i) regional outreach (only Gabú Region); (ii) financial resources (few resources available for subproject development); (iii) sustainable natural resources use (lacking activities to curb slash-and-burn agriculture and conserve forests); and (iv) no integrated approaches to vulnerability reduction (lack of integrated approaches). Building on the LDCF project while increasing the scope of its activities may thus clearly contribute to overall vulnerability reduction in East Guinea-Bissau while contributing to a development in the region which is sustainable in term of its environment, water resources, economy and social systems.</p>	<p>can avoid non-appropriation of techniques by communities, and thus turn LDCF impact more sustainable. This lesson will be taken in account within the new project.</p> <ul style="list-style-type: none"> Given the success of the LDCF project and a projected increasing socio-climatic vulnerability in the Gabú and Bafatá regions a replication of existing actions and increasing focus on prevention of slash-and-burn agriculture and forest fires is seen as an important step towards broader climate change adaptation in agriculture and water resources sectors. The current proposal is based on this key finding. Esp. with Bafatá entering: opportunity to get young and motivated technical personnel? This may be MSC students from outside, with G-B citizenship. The motivation of the current staff leaves to be desired. Get personnel to Gabú and Bafatá station, improve communication with Resilience office. Feeling that a bottleneck is number of staff and, in lesser degree, difficulties to work in Gabú.
<p>3.2.6.4. What is the potential for environmental, financial and economic sustainability of the project?</p>	<p><u>What has worked:</u></p> <ul style="list-style-type: none"> Overall potential for sustainability is large: the activities aim to contribute to the socioeconomic development of a region strongly hit by climatic extremes and change, while protecting the region's environmental resources and contribute to recuperation of degraded lands. But additional investments and scaling-up of activities would be required in order to maintain activities and support integration into daily routines of farmers. 	<p><u>Lessons learned:</u></p> <ul style="list-style-type: none"> Due to the fragility of the State, continuity of activities after the project would rely largely on own interest by the famers and support from decentralized structures established by the LDCF project, which, however, may have limited resources to contribute to on-the-ground interventions. Establishing means for such continuous involvement should be discussed at the start of the new Adaptation Fund project. One option would be the creation of a Local Initiative Fund that could support CBOs in developing subprojects relevant for their communities,

		<p>for example combat against forest fires, reforestation or income generation. Information exchange between tabancas, such as field visits, workshops, etc., could also be supported, based on the experiences with the 'Seja Dono de Fogo' community forest program. The Fund should focus on climate-relevant activities and grant support to those communities which are already highly affected by climatic variability and change.</p>

B. Interaction with other projects and programs in project region

The Adaptation Fund project proposal has synergies and complementarities with other other relevant recent or on-going programs in agriculture and water management in the planned target regions of Gabú and Bafatá, not limited to adaptation to climate change. These synergies and complementarities occur in the following domains: (i) improvement of technical and institutional capacity of stakeholders; (ii) increase of agricultural productivity and food security; (iii) construction of water infrastructure; (iv) management of natural resources; and (v) diversification of crop production.

In the domain of (i) improvement of technical and institutional capacity of stakeholders, the proposal project enter in complementarity with:

- Rural and Agricultural Sector Rehabilitation Project (PRESAR) supported by the African Development Bank. PRESAR's three objectives include the strengthening of rural organizations' capacity to support small-scale farmers and infrastructure in several Regions of Guinea-Bissau, including Bafatá and Gabú;
- The Intensification and Valorization of Local Agricultural Products project (DIVA) from 2008-2011 (US\$ 1.500.000). Carried out with support by the Italian Government in both Bafatá and Oio regions, the project helped in the capacity building of producers and their institutions;
- UNJP/GBS/301/PBF Gender Promotion Initiative (until 2015) with a US\$ 146,796 budget aimed to improve economic security and women's rights including in rural areas, investing in initiatives that ensure their economic and social empowerment through small-scale business activities; promotion and protection of women's rights and strengthening of organizational capacity of coordinating institutions;
- The Local Governance and Income Generating Activities support project was financed by the Dutch government from 2010-2013 with US\$200,000. The project aimed to improve governance by local communities and them in developing income-generating businesses and activities that would contribute for the improvement of their living conditions. Measures included micro-credit for agricultural and livestock production, provision of agricultural training, and technical assistance to prepare community plans.
- UNDP/GEF National Capacity Self-Assessment (2009-2011) made important progress in assessing the national capacity to implement the Rio Convention and developing a Strategy and Action Plan for Capacity Building on Environment Management, points that have directly contributed to the LDCF project development.

In the domain of (ii) increase of agricultural productivity and food security the proposal project has synergies and complementarities with the following projects:

- Several initiatives coordinated by the UN's Food and Agriculture Organization (FAO), including the International Fund for Agricultural Development (IFAD). FAO is implementing a number of projects, programs and initiatives that support Guinea-Bissau in the implementation of the Charter for Agricultural Development Policy, its action plan and what is part of the National Program of Food Security. FAO has projects in the whole country and also in the two project regions. It is worth mentioning two particular interventions: (1) The Food Security Project, which targets a number of policy, structural and on-ground interventions to address the now recurring issue food security in Guinea-Bissau; (2) Project for diversification and intensification of agriculture and valorization of agricultural production;

- GCP/RAF/461/SPA Strengthening Capacity of ECOWAS for Effective Comprehensive Africa Agriculture Development Program (CAADP). Implementation in West Africa (until 2015) aimed to improve the food security and nutrition situation in West African States and concrete progress of ECOWAS Member States towards achieving the UNMDG1, measured by increased and sustained agricultural growth in line with the six percent CAADP annual agricultural growth target (US\$4 million);
- TCP/SFW/3402 Support to Policy Initiatives for the Development of Livestock/Meat and Dairy Value Chains in West Africa (end 2014). The project with a US\$ 500.000 budget aimed to subsidize the creation of a suitable environment for the development of value chains for livestock and livestock products to achieve food security, poverty reduction and reduction of dependency on food imports. A successful implementation of the project would contribute also to integration of livestock producers into markets, job creation, improvement of living standards and sustainable increase of livestock production and productivities. The envisaged impacts of the project were in line with the objectives of ECOWAP. The project impact is also in line with the objectives of MDG, FAO's Strategic objective B and the Priority Area 1 of FAO Africa;
- WB/EU Emergency Project for Food Production (2009-2012) with an approximate budget of \$9 million, and other recent/ongoing emergency programs. The mentioned project sought to assist the recovery of 5,000 hectares of mangrove soils and lowland continental soils for rice growing and vegetable production. The aim was to increase rice production and reinforce food security at community level;
- UNDP's Community-Based-Organizations' Support Project in Gabú Region (OCB) (2008-2012). This project was financed from UNDP core funds for \$1.5 million and its implementation extended from 2008-2012. The project was active in the Gabú region and wanted to support several local community-based-organizations' members to develop agrarian production (crops and livestock) for their self-sufficiency, thus improving their food security;
- Project for agricultural production in urban and peri-urban areas which includes the (i) development of operational plans for the improvement in short-cycle animal husbandry in the wildlands (including Gabú and Bafatá regions), (ii) implementation of micro-projects for breeding, processing and marketing of animal products, and (iii) development of partnerships with private sector and support services (until 2016);
- Several other programs (e.g. by the Ministry of Agriculture) aim to retrieve former production values for cashew nuts and rice, with a particular focus on women's integration in the production chain. Further initiatives focused on community development and rural rehabilitation in Guinea-Bissau.

Regarding to the domain (iii) construction of water infrastructures, the proposal project has strong links to the following programs and projects:

- The Rural and Agricultural Sector Rehabilitation Project (PRESAR) which is implemented by the Ministry for Agriculture and Rural Development of Guinea-Bissau (MADR) with support from the African Development Bank. PRESAR three objectives include the reorganization and rehabilitation of water and agrarian structures.
- The proposal project also enters in synergy with the Program of Work of the General Directorate for Water Resources (DNGHR). Within the framework of the Sub-Regional Program to Fight against Poverty, the Government of Guinea-Bissau has been receiving significant finance for water resource management, as a member of UEMOA (the West African Monetary Union) and from OMVG (the Basin Organization for the Management

of the Gambia River). One of two interventions are particularly relevant to mention: (i) UEMOA's Rural Hydraulics Program in Guinea-Bissau, under which a total 300 water points are foreseen to be built, 50 of which are in the Gabú Region, plus a community capacity strengthening program on self-sustained water point management, including sensitization and training in hygiene and basic sewerage; (ii) Integrated water resource management for the hydrographical basins of river Kayanga-Geba, financed through a grant, within the framework of African Water Facility, under which it is foreseen that an Integrated Water Management Plan for the Kayanga-Geba basin will be prepared, as well as the financing of studies for the exploration of basin's irrigation potential with respect to the part of the various river that flows into Guinea-Bissau. The Kayanga-Geba basin is located in the same sites selected for this project application (project running until 2017).

With regards to biodiversity conservation, as fragmentation and pressures on natural resources increase throughout West Africa, areas such as Guinea-Bissau's Forest Belt have become important refuges for threatened species, providing also important national and transnational biological corridors and migration routes for large mammals in the region. In this domain of (iv) management of natural resources principal complementarities are with these projects and programs:

- The UNDP/GEF Project SPWA - Support for the Consolidation of a Protected Area System in Guinea-Bissau's Forest Belt project which supported the consolidation of protected areas (PAs) in the Forest Belt through establishment of an interlinked protected area system containing of two inland PAs (Boé National Park, Dulombi National Park) and three biological corridors (Tchetche, Cuntabane-Quebo, and Salifo), located at the junction of Gabú, Bafatá and Tombali 'Regions' in central south Guinea-Bissau. Furthermore, the project supported preliminary assessments on primary threats to biodiversity, including its root causes; undertook a detailed stakeholder analysis for PA implementation; and carried out an initial assessment of climate change risk on Guinea-Bissau's biodiversity. This latter study highlighted potentially disastrous impacts on land, water, and forest resources, with strong relevance for rural livelihoods across the entire Forest Belt region. This project builds on the findings of the GEF/UNDP-3650 project in that it (i) targets key root causes identified (persistent rural poverty, weak institutional capacity and lack of coordination among authorities) through small-scale productive interventions and mainstreaming of adaptation into development planning; and (ii) reduces potential environmental pressures on the Forest Belt via conservation agriculture and agroforestry (including positive impacts via reduced slash-and-burn agriculture). In cases where project beneficiaries are located near or around the Forest Belt, rural extension and capacity building components will be used to incentivize beneficiaries to prevent deforestation and overuse of natural resources. Potential subprojects near the project belt will be shortlisted as soon as the project starts in order to allow for timely implementation of these actions.
- UNDP/GEF Sustainable Land Management Project SLM. With a total budget of less than \$0.5 million, the long term aim of the project is to contribute to the recovery of degraded land through institutional and individual capacity building. It is doing so by integrating sustainable land management issues into national development strategies, completing the National Action Plan to Combat Desertification (PAN/LCD), reinforcing, harmonizing and integrating the institutional, technical, organizational and legal capacities in the policy for SLM.
- The Rural and Agricultural Sector Rehabilitation Project (PRESAR) which is supported by the African Development Bank. One of the objectives of PRESAR focuses on capacity

building in integrated natural resource management and land management at the level of villages.

Finally, regarding (v) diversification of crop production this proposal enters in complementarity with:

- The School Horticultural Activities Support Project which is developed in collaboration with World Food Program (WFP). This project targets, among other, 50 schools in the Gabú region and aims to diversify and intensify of agriculture as well as valorization of agricultural production.
- The Intensification and Valorization of Local Agricultural Products project (DIVA) from 2008-2011 (US\$ 1.500.000) which also focuses on the intensification and diversification of agricultural production in Guinea-Bissau.

I. INTRODUCTION

Guinea-Bissau is located in West Africa, it is a small country of 36.125 km² and a population of approximately 1.700.000 inhabitants.

The climate divides the country into three agro-ecological zones. The study area (northeast) is characterized by a Sudanese climate with two distinct seasons: a dry season between November and May and a rainy season from June to October. Precipitation in the site identification area varies between 1,100 and 1,400 mm / year. The evapotranspiration rate is 2,507 mm and the average annual temperature is 27,4 ° C. Currently, almost 80% of the annual precipitation falls during the months of July, August and September.

As part of the preparation of the project, a team composed of Mr Apá da Costa, Rural Hydraulic Engineers and Mangla Nantchia, agronomist, started from 3 to 9 November 2016 in the different Sectors of the regions of Bafata and Gabu. The mission was carried out in collaboration with regional and sectoral technical authorities, traditional authorities, farmers and herders. The objective of the mission is to identify sites vulnerable to climate change for possible support in the implementation of the project while proposing technical solutions to mitigate the impacts of climate change on the daily lives of producers and breeders. Support is provided for hydro-agricultural development (shallow water), the construction of drinking troughs (rainwater retention basin or mini-dam) for livestock and water points for the supply of clean drinking water for population..

II. CONTEXT

During the 1950s, the project area was very rich in water. The water resources come from a part of the rains, on the other hand from the contributions of the basins of the rivers Corubal, Geba and Cachéu. Rain is the main freshwater resource for agricultural production. However, a trend reduction in recent years is recorded for rainfall as well as for the rainy season. If in the 1950s the dry and rainy periods were each spread over half the year, the rainfall trend in the last 50 years shows a quantitative and qualitative decrease in rainfall. This implies an increase in the water deficit period for agropastoral activities. Today, the dry period gained a month on the rainy season. In this area, the rainy season extends from June to October.

Despite this modest freshwater potential, its distribution in space and time is very irregular with periods of excess (August, September) and deficit periods (October to June), with the monthly deficit exceeding 100mm (January To May). Thus, the lack of hydraulic infrastructure for stormwater management is a problem that does not always allow food crops to complete their vegetative production cycle, which contributes to a chronic decline in yields, and thus drought and lack of productivity, make livestock production more difficult and less productive.

Human activities related to the irrational exploitation of forest resources and the decentralization of agriculture in watersheds have contributed to deforestation and soil degradation not only in the plains but also at the lowlands. Soil erosion, caused by runoff during the rainy season, resulted in the silting of several plains, particularly in the regions of Gabú and Bafatá.

In this context, it becomes imperative for producers to adapt to climate change by adopting hydraulic systems and infrastructure needed to control and manage water for crop and livestock production that can meet food needs..

III. LOGICAL CHOICE OF SITES AND TARGET GROUPS

The selected sites are part of an effort to support the efforts of farmers (farmers and herders) to adapt to climate change to maintain and increase plant and animal production essential for food and nutrition security, namely rice, meat and milk. The corridor, consisting of the administrative sectors of Pitche, Pirada, Gabú and Sonaco in the region of Gabu and Contubuel and Ganadu in the Bafatá region, is most affected by the effects of climate change, which is more vulnerable in terms of infrastructure, Adaptation and where the water deficit is greatest at the country level, food and nutritional insecurity is more pronounced.

The target group would be all small-scale producers and ranchers, particularly rice-producing women and breeders who are often the first victims, but also the main actors in the fight against food insecurity, grouped in a village and / or group Of villages sharing a common area, whose interests converge, producers and / or pastoralists already engaged, with experience in the fields of activities where the will marked by a concrete initiative.

IV. SITES IDENTIFIED BY THE MISSION

4.1. Methodological approach

A first list of potential villages and sites was established during the working sessions with the regional directorates of agriculture and livestock of Gabu and Bafatá. The targeted area was deliberately restricted to the regions of Gabú, Pitche, Pirada, Gabú and Sonaco and Bafata, sectors of Contubuel and Ganadu, in accordance with the logic described in paragraph 3 above and whose adaptable rice potential and Number of livestock are important. The mission then visited pre-selected villages for interviews with farmers (farmers and / or herders) and on their respective sites for the recognition and diagnosis of exploitation problems.

During the mission, the team visited several villages and sites in both regions. In each region and village, the team exchanged information on their agropastoral activities and the main constraints with regional authorities, producers, rice farmers and herders. Discussions are followed by joint visits to the sites proposed by the villagers. During the exchanges, the observations and information gathering are made from the explanations of the resource persons and the producers / breeders.

In all the villages / sites visited by the mission, the major constraint identified by farmers and ranchers, which contributed to the decline in yields of agropastoral activities, is the deficit in irrigation water to complete the vegetative cycle. Beyond the water problem, the lowlands are confronted with problems of declining fertility, with the corollary, the strong presence of weeds of grass families and some legumes, especially Striga. Potential beneficiaries also noted the

lack of agricultural equipment, equipment and inputs, post-harvest conservation equipment and insufficient technical support.

With regard to livestock activities, the lack of water has led to a decline in the water level in the wetlands, resulting in a reduction in the growth and production of fodder plants and in the increase in the difficulty of watering livestock. Breeders are obliged to draw water in the majority of cases to a depth that varies between 10 to 30 meters to water, sometimes, more than 100 head of cattle. Also, most breeders are obliged to practice long-distance transhumance.

Vegetable activities are practiced in almost all villages as a source of very important income for women to cover the costs of schooling and medical care for children. But the main constraints for the development of market gardening are the lack of water, the invasion of animals and the lack of access to small agricultural equipment and inputs.

4.2. Sites selected by the formulation mission

A total of 18 sites have been selected for possible interventions of the project in preparation, namely:

1. Bucuré Boboti site - Gabú region, Pitche area
2. Copiro site - Gabú region, Pitche area
3. Sago / Fulamori site - Gabú region, Pitche area
4. Soncocunda site - Gabú region, Pirada area
5. Sissaucunda site - Gabú region, Pirada area
6. Durabali site - Gabú region, Pirada area
7. Sambataco site - Gabú region, Pirada area
8. Cumpaghor - Gabú region, Gabú area
9. Bada site - Gabú region, Gabú area
10. Colicunda site - Gabú region, Sonaco area
11. Madina Sara site - Bafatá region, Contuboel area
12. Manatu Mansona site - Bafatá region, Contuboel area
13. Calugada site - Bafatá region, Contuboel area
14. Sanecunda site - Bafatá region, Contuboel area
15. Suna Nhamabé site - Gabú region, Contuboel area
16. Cuncana site - Bafatá region, Ganadu area
17. Pacua site - Gabú region, Ganadu area
18. Cantacunda site - Gabú region, Ganadu area

V. BRIEF DESCRIPTION AND SYNTHESIS OF DIAGNOSIS OF IDENTIFIED SITES

5.1. Sites in the region of Gabú

5.1.1 Site of Bucuré Boboti

The village of Bucuré Boboti is linked to the Gabu-Bruntuma regional road by a rural road of 7 km. The runway is designed for limited traffic in one direction at a time. This trail is characterized by numerous points highly degraded by runoff and watercourses which render it, during the heavy rains, uncontrollable. The village is small sizes with about fifteen houses, inhabited by farmers and breeders whose population is about 138 inhabitants.

The method of land acquisition in Bucure Boboti is by inheritance. The land is in no case to be rent, but it can be loaned without interest. There are therefore no land conflicts at this site.

The identified shoal is located in the vicinity of the village and consists of a depression with a potentially exploitable surface of about 50 hectares, broad and flat. It is fed with water by the runoff of a small watershed and a rise of the water table.

According to the operators, the flooding of the lowest part is only verified in August and dries almost immediately after the rainy season.

In general, in the plains, the natural forest of the valley drainage basin is deforested because of human activity and therefore susceptible to erosion.

Despite the low yield, rice production is practiced at this level by the rice farmers in the four villages: Bucure-Boboti, Bucure-Dulo, Sintchã Dara and Sintchã Barros. In 2015, the site was flooded.

Soil preparation is manual for most working women. A small number of women are supported by their husbands who plow with the ox plow. Sowing is on the fly. Producers do not use inputs such as chemical fertilizers and pesticides. They use seeds of local varieties.

Although the size of the villages is average, the inhabitants have a large number of livestock. By the data of the regional veterinary service, for all the villages around Bucure Boboti, the number of livestock is estimated at 1100 head of cattle. To ensure water for hundreds of livestock breeders dig and draw traditional well water. At 400 meters from the village, the rural trail linking it to the regional road crosses a stream with a small lake that keeps water until January. The relief of this small watercourse allows, with a development, to create a culinary basin for the watering of the livestock of the zone.

In terms of village water supply, the village does not have a drinking water point for human consumption, nor for livestock, nor for students at school.

The main problems diagnosed for the villages in the area are as follows:

- ✓ Watersheds, practically without vegetation cover
- ✓ Difficulties of drainage of plots located at the center of the shoal during floods and flooding of plots during intense rains

- ✓ Lack of knowledge about how to do the adoption of adaptation measures to address water deficit problems for crop irrigation and livestock watering.
- ✓ 4. Lack of water supply infrastructure for livestock.

5.1.2 Site of Copiró

The village of Copiro is located at 1 km from regional road Gabu-Bruntuma and bound to it by a track. It is a large village with a population of 138 inhabitants.

At the level of this site there is no land without owner and the mode of acquisition of the land in this village is by inheritance and each family know the limits of his land and managing the needs of all members. In case of lack or abundance, it can be borrowed or lent without interest. There is no land conflict at the level of this site.

In terms of village water, the village boasts a water point equipped by a manual pump for the water. This watering can not meet the needs of the population.

Rice field site is not visited by the mission, because the beneficiaries encountered, water for rice production is not a major problem and the water courses that watering livestock dries on the eve of the rainy season. The village has a shallow of 111 hectares, cultivated by 10 villages including the village of Copiro: Binam, Sintchan Mali, Sintchan Malam, Madina Copiro, Cupe, Rauna, Canhamando, Afia and city of pitch. The bottom was partially built by the OMVG in 2007.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn plows.

The main problems faced by operators of lowland are:

- ✓ No control of water and low soil fertility) 3.,
- ✓ The silting and the strong presence of weeds grasses and legumes family especially Striga,
- ✓ The lack of agricultural equipment and inputs, post-harvest equipment and technical support.

5.1.3 Site of Sagoia/Fulamori

The village of Fulamori is located in the left bank of the Corrubal River, just a dozen meters away. It is 12 km south-east of the town of Pitche and connected by a rural track, recently developed by OMVG. It ends at Fulamori in the form of an access ramp to the ferry that ensures the crossing of the river towards the Republic of Guinea.

The village is small with about fifteen houses, with a population of about 138, but it is surrounded by several villages whose main activity is livestock. Its proximity to the perennial water source transforms it into a true pasture center during the most water-deficient months. Data from the regional veterinary service indicate that for all the villages around Fulamori, the number of livestock is estimated at 1100 head of cattle. The herds come from the villages of Sagoia, Rauna, Benfica, Paiama, Canhamando, and Bentem Misside.

The Corrubal River has a permanent watercourse and is the most used water source for watering the livestock of the area, despite its very difficult access for animals. During our visit

the difference between the coastline of the natural terrain and the coast of the body of water was approximately 15 meters and a slope of about 1/2. Certainly, during the low (the months of April, May and June) the difference mentioned above will be more important.

Currently, the ferry access ramp is also used by the herds of cattle to drink. Of course, this situation complicated the management of the limelight in particular and transports in general and endangers the lives of each other. During the construction of the runway, the construction of specific ramps for the watering of livestock was considered, but a reason, without knowledge of the populations, the work was not realized.

A possible development of several ramps to the River will facilitate the herding by the breeders of the area.

The main problems diagnosed for villages in the area are the following:

- ✓ The Access to the source of water for the watering of livestock is difficult
- ✓ The high probability of accident in the operation of the access ramp to the ferry for carriers and water for herds.
- ✓ Lack of infrastructure of water supply for the livestock.

5.1.4 Site of Soncocunda

The village of Soncocunda is located south of the town of Pirada. It is linked to the regional road Gabu-Pirada by a small rural trail of 5 km. It can be used throughout the year thanks to its low slope and absence of rivers.

In terms of size, the village of Soncocunda is large and populous by 1300 inhabitants. Soncocunda share the same space for rice than for grazing with 5 villages namely: Soncocunda, Sissaucunda Samanco, Sissaucunda Aliu, Golere, Sintchan El Laube. The population of the area is estimated to have 3,000 people and the number of livestock is assessed in addition to 2,000 head.

The site of paddy field operated by whole villages is located 1.5 km from the village Soncocunda. It is very large with a potential conversion of 150 ha. The rice is part of the plain of the river Bidigor. In topographical terms, the site is flat with a small courtyard of ill-defined water which dries quickly after the rainy season. The rice field is supplied with rainwater from a small watershed. That is a few hours after the rains bottom remains without water because they flow to the river Bidigor just some metres to the bottom. This year, the phenomenon arrived in the midst of flowering of rice and threatening the production of the majority of the plots in the bottom. Lack inputs, agricultural materials, the decline in the fertility of the soil, the strong presence of weeds of grass family and some legumes as well as Striga, silting of bottom caused by water erosion are rice production constraints at the level of site.

Soil preparation is manual for the majority of women and the minority is in bovine plow with the support of their husbands. Producers apply direct seeding on fly and use the following local varieties: Herbel (60 days); Mussé Hu1 (C4 - 90 days); Adulai, Fulantcho and Nhada (120 days).

Concerning farming, there is a lack of water. To feed the livestock water farmers dig and get the water from traditional wells with depths ranging between 10-15 meters

The main problems diagnosed for the village-site of the area are the following:

- ✓ The slopes, practically without vegetation cover
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do the adoption of adaptation measures to address water deficit problems for crop irrigation and livestock watering.
- ✓ Insufficient water supply infrastructure for livestock

5.1.5 Site of Sissaucunda Aliu

The village of Sissaucunda Aliu is located on the same axis with the village of Soncocunda. The two villages share the same track and paddy field, and Sissaucunda is 2 km south of Soncocunda.

The village of Sissaucunda and the surrounding area (villages of Sissaucunda Aliu, Sissaucunda Samanco, Nhapo, Golere, Soncocunda and Sintchã El Laube) benefited from a mini-earth dam with a reinforced concrete threshold built by OMVG but its lake In February, according to the peasants this is due to the silting of the lake by the runoff during the heavy rains. The fact was noted by the mission. In the current state the mini-dam does not solve the problem of livestock watering in the area. While this is a real headache for breeders. To address this problem, there will need to be a one-time intervention.

5.1.6 Site of Durbali

The village of Durbali is close to the historic village of Cansala (Capital of the Gabu Empire). Easy access, linked to the Gabu-Pirada regional road by a 3 km rural trail. It is accessible all year round.

The entire population of villagers who farm the rice field is approximately 600 people divided into three villages, namely: Durbali, Madina Bocar and Lumbutugo. At the level of this site there is no land without belonging and the method of acquisition of the land in this village is by inheritance and each family knows the limits of its land and manages it at the need of all the members. In case of insufficiency or abundance, it can be lent without interest. There is no land conflict at the site level.

The Durbali rice field has an area of about 60 hectares and in topographic terms, it presents a configuration not homogeneous, flat, narrow width not exceeding 40 metres and quite long. The site is well supplied with fresh water by a watershed and has a Court of temporary water. His cross slope is accentuated, while the longitudinal is low. Despite the complexity of its configuration and its ill-defined bed (the side of the bed is almost equal to the coast from the rest of lowland), the surface runoff and storm water drainage goes fairly well, even after heavy rains. The watershed is partially deforested for the practice of agriculture of plateau and this is compounded by intense pastoral activity.

At site level, the mode of preparation of the soil is manual and animal traction (the plough). Rice is grown in nurseries and transplanted after 30 days in a final field. The varieties used are local and are: cural (drought-resistant 90 days); Sorilumbato, Bissau and Rasta all (more at least 120 days). Farmers use no fertilizer and pesticides.

The constraints of rice production to the level of this site are: the presence of weeds of grass family and some legumes, the lack of materials and agricultural inputs, lack of post-harvest facilities and technical support.

The main problems diagnosed for the village-site of the area are the following:

- ✓ The slopes, practically without vegetation cover.
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do the adoption of adaptation measures to address water deficit problems for crop irrigation and technical support.

5.1.7 Site of Samba Taco

The site of Samba Taco regroups several villages around the valley of the river Bidigor. The total population of all the villages is 500 people. At this site, the land acquisition method is inherited and each family knows the boundaries of its land and manages it if necessary of all the members. In case of insufficiency or abundance, it can be lent without interest. There are no land conflicts at the site level. Part of the valley is exploited exclusively for pasture grazing.

The Valley of Samba Taco has an area estimated in 50 ha, of which about 20 ha are grown for rice production. The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn plows. The constraints of rice production to the level of this site are: the presence of weeds of grass family and some legumes, the lack of materials and agricultural inputs, lack of post-harvest facilities and technical support.

In topographical terms, it presents a smooth, flat and with a variable width configuration. The Valley is well supplied with fresh water by a watershed and has a temporary minor bed that runs only in January. The cross slope of the plateau to the bottom of the Valley is accentuated, while the longitudinal is low.

Samba Taco and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle.

The watershed is partially deforested for the practice of farming and this is exacerbated by intense pastoral activity in the area.

The main problems diagnosed for the village-site of the area are the following:

- ✓ Slopes, practically without vegetation cover
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do the adoption of adaptation measures to address water deficit problems for crop irrigation
- ✓ Lack of water supply infrastructure for livestock.

5.1.8 Site of Cumpaghor

The village of Cumpaghor is close to Gabú, easy access; it is on the Gabú-Pirada regional road. The total population of all the villages totals 500 people.

The method of land acquisition in Cumpaghor and other villages is by inheritance and at this site there is no land without belonging to an individual. Each family estate is known by the villagers and each family manages its land at the need of all the members. The land is in no

way subject to rental, but it can be loaned without interest. There are no land conflicts at the site level.

The Cumpaghor paddy field has a usable area of approximately 100 hectares and in topographic terms it has a homogeneous, flat, narrow configuration, the average width of which does not exceed 50 meters. It is long and serves several villages, such as Cumpaghor, Canhanque, Sintchan Aladje, Sintchan Luntam, Sintchan Bricama, Amedalae. The site is well supplied with freshwater by a relatively large catchment area with a permanent watercourse during the months of August, September, October and November. The configuration of the Cumpaghor site, despite its poorly defined bottom (the bottom's rib is almost equal to the coast of the remaining shoal), the surface runoff and storm water drainage goes fairly well, even after Heavy rain. For wet years this situation favors production, but on the contrary for the dry years the situation aggravates the deficit in irrigation water. The shoal was partially developed by an NGO in 2007.

Soil preparation is done manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn plows. The most widely used varieties are: Nerica L14 and Nerica L19- 120 days, DEPA-90 days, Sahel 94-115 days. The rice is grown in nurseries and transplanted after 30 days in a definitive field.

Main lowland constraints are: total uncontrolled water, the decline in the fertility of the soil, the strong presence of weeds from the family of grasses and some legumes, silting caused by water erosion, lack of agricultural machinery, lack of agricultural inputs, the lack of post-harvest facilities, the lack of technical support.

The watershed is completely deforested for the practice of agriculture of plateau, which makes it very vulnerable to silting by water erosion.

The main problems diagnosed in the village / sites are as follows:

- ✓ The slopes, practically without vegetal cover
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do for adoption of adaptation measures to address water deficit problems for crop irrigation

5.1.9 Site of Bada

The village of Bada is located in the vicinity of the town of Gabu. It is located along the regional road Gabú-Pirada. It is a large village, with a hundred houses, whose population is about 1000 inhabitants. The way land is acquired, as in the majority of villages in Guinea-Bissau, is by inheritance, each household has its own land that it can lend without interest. Land conflicts are rare and if it happens, are usually settled amicably or through wise men of the village.

The paddy field serve not only the population of Bada and the villages of Coiada, Djibata, Sancalancunda, Lenquirim, Mamadu Embalo and part of the population of Gabu and part of the plain of the river Campossa with a suitable potential area of 150 hectares. In topographical terms, the bottom is deep and flat, powered by a fairly large watershed and groundwater that is almost at the surface of the shallow freshwater. The watershed is completely deforested for the practice of agriculture of plain farming and this is aggravated by the high density of the population. The site suffers from degradation due to erosions and also due to the solid waste

of households from the city of Gabu. Part of this valley was subject to a development by an NGO in 2008.

The practice of preparation of the soil is manual by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn plows. The most widely used varieties are: Nerica L14 and Nerica L19 - 120, DEPA-90 days, Sahel 94-115 days. Among the constraints of production faced by producers include the decline in the fertility of the soil, the strong presence of bad herbs family of grasses and some legumes, the lack of materials and agricultural inputs, post-harvest facilities and lack of technical support.

The main problems diagnosed in the village / site of the zone are as follows:

- ✓ Slopes, practically without vegetation cover
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do for the adoption of adaptation measures to address water deficit problems for crop irrigation
- ✓ Degradation of agricultural land through silting and deposition of inorganic solid waste from urban residents of Gabú.

5.1.10 Site of Colicunda

The Colicunda site serves several villages around the valley, including: Nemataba, Velingara, Sintchã Bacar and Iero Maro. The total population of all villages is 1,500 people. At this site, the land acquisition method is inherited and each family knows the boundaries of its land and manages it if necessary for all the members. In case of insufficiency or abundance, it can be lent without interest. There are no land conflicts at the site level.

The Colicunda Valley has an estimated 70 ha in area. In topographical terms, it has a non-homogeneous configuration, flat in its central part and with a width, from upstream to downstream, variable of a few tens of meters to more than 50 meters. The Valley is well supplied with fresh water by a watershed and has a temporary minor bed which dried up in December. The cross slope of the Valley is accentuated, while the longitudinal is low.

Despite the chronic problem of lack of water to complete the vegetative cycle and several constraints of production, such as: the decline in the fertility of soils and performance, the strong presence of weeds, the lack of materials and agricultural inputs and the lack of technical support and guidance, the paddy field is 90% cultivated. The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn plows.

A belt of the forest round is well preserved, throughout the two immediate side of the Valley. Despite forest conservation from the slope, the risk of silting remains a problem for the operators of the rice field.

The main problems diagnosed in the village / site is as follows:

- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge about how to do for the adoption of adaptation measures to address water deficit problems for crop irrigation.

5.2. Sites of Bafatá

5.2.1. Site of Madina Sara

The village of Madina Sara is located on the national road Bafatá-Cambadju (border Senegal) near Contuboel, easy acces. The total population of all the villages is 500 people.

The mode of acquisition of land at Madina Sara and other villages is by inheritance and at the level of this site there is no land without belonging to an individual. Each family estate is known by the villagers and each family manages his land for the needs of all members. The land is in no way to rent, but it can be lent without interest. There is no land conflict at the level of the site.

The paddy field in Madina Sara has a usable area of about 50 hectares, and in topographic terms, it has a homogeneous, flat, narrow and well sitting configuration, which the average width does not exceed 35 metres. It is long and serves several villages, such as Madina Sara, Cansama, Sitcha Demba Djau, Sintcha, Django, Bricama, Sindja Demba and Sintcha Mamadu. Further upstream, this lowland is shared with the villages of Galugada, Talto, Sare Djeno, Cambadju and Sintcha Djida. At the level of the village, Madina Sara, the site is well supplied with freshwater by a relatively large watershed, with a permanent water courses during the months of August, September, October and November. Despite the fact that in some places the river bed is poorly defined, especially upstream of Madina Sara, the surface run-off and stormwater drainage runs quite well, even after heavy rains. For wet years this situation favors production, but on the contrary for the dry years the situation aggravates the deficit in irrigation water.

True that the slopes are covered by a layer of semi-dense forest, the road that runs through the Valley is the main factor of silting up of the rice fields.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The technique used is the transplanting. Rice is grown in nurseries and transplanted after 30 days in a final field. The varieties used are: uancaran, Banimalo, Demeremedjel all 90 days and Marosirem 120 days. This same bottom is used by women in activities of outstanding gardening during the dry season.

The main constraints of shallow are: the decline in the fertility of the soil, the strong presence of weeds from the family of grasses and some legumes, lack of agricultural inputs, post-harvest facilities and equipment and the lack of technical support.

Madina Sara and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. But, thanks to the support of the Spanish Cooperation, the village benefits from a large-scale drilling equipped with a high cistern, powered by solar electric pump and two concrete drinking troughs.

The main problems diagnosed in the village / sites are as follows:

- ✓ Siding of the rice fields
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season

- ✓ Lack of knowledge about how to do the adoption of adaptation measures to address water deficit problems for crop irrigation

5.2.2. Site of Manato Mansona

The village of Manato Mansona is 4 km from the Bafata-Cambadjú national road (Senegal border). It is connected to the national road by a narrow track that branches off at the level of the Madina Sara village. The trail is accessible all year round, but with very critical points during the rainy season. The village is small in size, with about ten houses and a population of about 100 people.

The method of land acquisition in Manato Mansona and other villages, with which the rice fields share, is by inheritance and at the level of this site there is no land without belonging to an individual. Each family estate is known by the villagers and each family manages its land at the need of all the members. The land is in no case for hire, but it can be loaned without interest. There is no land conflict at the site level.

The rice field of Manato Mansona, which is 3 km from the village, has a usable area of approximately 120 hectares and in topographic terms it has a homogeneous, flat and well-seated configuration, the average width of which exceeds 100 meters. It is long and serves several villages, such as Sintchã Samba Djiba, Djabel, Cuncusira, Sintchã Mama, Fataco fula, Sintchã Turé, Braima Soló, Manato II and Sintchã Bilali / Brale.

The shallow water is well supplied with freshwater by a relatively large watershed, with a permanent stream that dries up just after the rainy season. Its configuration favors the natural drainage of runoff water, despite its defined bed. For wet years this situation favors production, but on the contrary for the dry years the situation aggravates the deficit in irrigation water. The way of preparation of the soil is manual. The rice farmers cultivate the land using the <balinculo>technique used to combat weeds and for conservation of water. The technique used is the transplanting. Rice is grown in nurseries and transplanted after 30 days in a final field. The varieties used are the following: Djulukeme (90 days), Banimalo (90 days and Djumorouda (60 days) according to the rice farmers</balinculo>).

This same bottom is used by women in activities of outstanding gardening during the dry season.

Manato Mansona and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. But this village has only a diameter wells that dried up in February. In terms of village water, Manato is disadvantaged and the problem of access to drinking water is a daily challenge for residents. Of course, in this situation, the watering of livestock with proper water remains a dream.

The main constraints of the shallow are: the decline in the fertility of the soil, the strong presence of especially the Striga weed, the lack of inputs, post-harvest facilities and equipment and the lack of technical support.

The main problems diagnosed in this village/site are the following:

- ✓ Siding of the rice fields.

- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season.
- ✓ Lack of knowledge of how to do the adoption of adaptation measures to address water deficit problems for crop irrigation.
- ✓ Lack of access to drinking water for the population and water for livestock watering.

5.2.3. Site of Galugada

The village of Galugada is located on the national road Bafatá-Cambadju (border Senegal) with easy access. It is large with a hundred houses and village water infrastructure. The population is 1000 people.

The mode of acquisition of land at Galugada and in the villages with which it shares the rice field is by inheritance and all the lands are owned by people. Each family estate is known by the villagers and each family manages his land to the needs of all members. The land is in no way to be rent, but it can be lent without interest. There is no land conflict at the site level.

The paddy field of Galugada is the continuity of Madina Sara, the total usable area is approximately 50 hectares and in topographic terms, it presents a configuration not homogeneous, broad, with accented cross slope, but a low longitudinal. At the village level, the site is supplied with freshwater by a small watershed, with a temporary stream during the months of August and September. Despite the no definition of river bed surface runoff and stormwater drainage happens momentarily, even after heavy rains. This situation worsens the deficit irrigation water and do not favors rice production.

The slopes are totally proven vegetation cover and rice field are subject to silting.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The technique used is sowing due to insufficient water. The varieties used are: Bandjulai, Banimalo, Santandjan, CEFA-PRETO, DEPA every 90 days, Djulkeme, Uancaran (90-120 days), Barrafito, Tabuia (60-90 days).

This same bottom is used by women in activities of outstanding gardening during the dry season.

The main constraints to production in the Valley are: the decline in the fertility of the soil, the strong presence of weeds from the family of grasses and some legumes, lack of agricultural inputs, post-harvest facilities and equipment and the lack of technical support.

Galugada and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. The watering of herds is done by manual creation of water at an average depth of 15 meters. This is the major constraint for the development of farming in the village.

The main problems diagnosed in this village/site are the following:

Siding of the rice fields

Difficulties in retaining and managing floods to flood rice plots during the rainy season

Lack of knowledge of how to do for adoption of adaptation measures to address water deficit problems for crop irrigation

✓ **The main problems diagnosed in this village/site are the following**

5.2.4. Sites de Sanecunda

The village of Sanecunda is located near the Senegal border 6 km from Fajonquito and 9 km from the Bafatá-Cabadjú national road (Senegal border). It is connected to the Canhamina-Fajonquito trail by a narrow track, which is accessible the all year, but with very critical points during the rainy season and in poor condition. The village is small, a little isolated, with nearly five houses and a population of about 20 people without potable water for human consumption and for livestock which are many in the village. It has a traditional well dug by the villagers themselves that dried up during the dry season, forcing the displacement of breeders in search of long-distance water sources.

To some ten metres from the village there is a shallow where women practice rice cultivation. The mode of acquisition of the land here is also by inheritance. Each family estate is known by the villagers and each family manages his land the needs of all members. The Earth is in no way to rent, but she can be lent without interest. There is no land conflict at the level of the site.

The rice field has a usable area of approximately 30 hectares and in topographic terms, it presents a smooth, flat and comfortable configuration, which the average width does not exceed, 25 metres. It is long and serves several villages, such as Sanecunda, Maro Baque, Samatiana, Sintcha Framba, Brecolon, Sintcha Bacar and Sintcha Bala.

At the village level, the site is supplied with freshwater by a small watershed, with a temporary stream during the months of August and September. Despite the no definition of bed surface runoff and stormwater drainage happens momentarily, even after heavy rains. This situation worsens the deficit irrigation water and does not promote rice production.

The immediate slopes of the Valley are consisting of savannah grass (pasture area), so very susceptible to water erosion. This area contributes to the silting up of the rice fields.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The rice farmers cultivate the land using the <balinculo>, technique used to fight weeds and for conservation of water. The technique used is sowing to pane. The varieties used are: Banimalo, Auael, and Tabadjenque every 90 days. Baghaghar 90-120 days</balinculo>.

The main constraints of the production in this Valley are: the decline in the fertility of the soil, the strong presence of especially the Striga weed, the lack of inputs, post-harvest facilities and equipment and the lack of technical support.

The main problems diagnosed for the village-site are the following:

Siding of the rice fields

Difficulties in retaining and managing floods to flood rice plots during the rainy season

Lack of knowledge of how to do for the adoption of adaptation measures to address water deficit problems for crop irrigation

Lack of access to drinking water for the population and water for livestock watering.

5.2.5. Site of Cuncana

The village of Cuncana, initially, is not part of the villages selected in the working session with the Regional Directorate of Agriculture and Livestock. It is located between the village of Pacua and Ga-Mamaudu (capital city) of the administrative sector of Ganadu. The track which connects it to Ga-Mamudu crosses a shallow, whose width is estimated in 80 meters, flat and comfortable. This lowland is fed with fresh water by a small watershed, without a permanent stream or a defined minor bed. As we move downstream, the river becomes temporary during the month of August and September and the bed is defined.

The shallow upgrading rate is over 95%, but at the time of the mission the water stress of the plants in full bloom, threatening the productivity of the majority of the plots in the shallows, was noticeable at the lack of irrigation water. This valuation rate shows the willingness and commitment of women in food production to ensure food self-sufficiency for their families regardless of the condition.

The Cuncana lands are acquired by inheritance and all the land has an owner. Each family estate is known by the villagers and each family manages his land to the needs of all members. The land is in no way to rent, but it can be lent without interest. There is no land conflict at the level of the site.

The rice field of Cuncana has an exploitable area over 100 hectares and in topographic terms, it presents a uniform configuration, wide, with a weak transverse slope but a weak longitudinal one. Despite the low longitudinal slope runoff drainage occurs quickly, even after heavy rains. This situation worsens the deficit irrigation water and do not favors rice production.

The slopes are mostly covered by a layer of semi-dense forest but, the track that runs through the Valley is the main factor of silting up of the rice fields.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The technique used is sowing in part because of lack of water.

The main constraints to production in the Valley are: the decline in the fertility of the soil, the strong presence of weeds from the family of grasses and some legumes, lack of agricultural inputs, post-harvest facilities and equipment and the lack of technical support.

Cuncana and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. The watering of herds is done by manual creation of water at an average depth of 15 meters. This is the major constraint for the development of farming in the village.

The main problems diagnosed for the village-site are the following:

Siding of the rice fields

Difficulties in retaining and managing floods to flood rice plots during the rainy season

Lack of knowledge of how to do for the adoption of adaptation measures to address water deficit problems for crop irrigation

- ✓ Absence of infrastructure for livestock watering.

5.2.6. Site of Pacua

The village is located a kilometer from Ga Mamudu, City capital of the administrative sector of Ganadu. On the way home, approximately 250 meters, the track which gives access to the village runs through a Valley, whose width reached 150 meters. This Valley is operated by the women of the village to the rice production. Beyond rice production, one of the activities of the Pacua is farming. The track remains accessible throughout the year, but she is in a bad state of conservation.

In terms of size Pacua is a big village with hundreds of houses. Pacua population totals about 1,500 people. At the level of this site, the farm land is acquired by inheritance and each family know the limits of his land and managing the needs of all members. In case of lack or abundance, it can be lent without interest. There is no land conflict at the site level. A part of the Valley is operated exclusively for grazing of herds.

The Pacua Valley has an estimated in 180 ha, potential area which approximately 80 hectares is cultivated for the production of rice and the rest is used for grazing. It can serve several villages in the Pacua round, such as Candafe, Sintcha husband, Sintcha Mamadu I, Sintcha Sulai and Sointchã Mamadu II. In topographical terms, it presents a smooth, flat and with a variable width configuration. The Valley is well supplied with fresh water by a watershed and has a temporary minor bed that dries immediately after the rainy season. The cross slope of the plain to the bottom of the Valley is accentuated, while the longitudinal is low.

The watershed is partially deforested for the practice of agriculture of plateau and this is compounded by intense pastoral activity in the area.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The technique used is sowing a pane and one used for cultivating the land is called "Balinculo", a technique to fight weeds and water conservation. A portion of the crop is kept for the seed. The varieties used are: Guireghade, Djundiguide, Banimalo, Barafita, Lancaran, Maliulem, Comoco and Tchamuel - 90 days; CEFA COIO (white rice) E CEFA PRETO (black rice) - 60 days.

Pacua and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. This livestock is watered by the manual creation of the water at a depth of more than 10 meters.

The rice production and farming in the area are: the presence of weeds of grass family and some legumes, the decline in the fertility of the soil, the lack of materials and agricultural inputs, lack of equipment Post-harvest and manual flocking and lack of support and technical support.

The main problems diagnosed for the village-site of the area are the following:

- ✓ The slopes, practically without vegetation cover
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season
- ✓ Lack of knowledge of how to do for the adoption of adaptation measures to address water deficit problems for crop irrigation
- ✓ Lack of water supply infrastructure for livestock

5.2.7. Site of Cantacunda

The village of Cantacunda is located 19 km from Gã-Mamudu (the capital city) of the Ganadu sector. It is connected to Gã-mamudu by a very degraded track with impassable sections during the rainy season. Fortunately, it has an alternative track used while the main track remains impractical. The village is large in size, with more than 50 houses and a population of about 1200 people.

Less than 200 meters from the village there is a shallow where women practice rice cultivation. The mode of acquisition of the land here is also by inheritance. Each family estate is known by the villagers and each family manages his land to the needs of all members. The land is a not for rental, but it can be loaned without interest. There is no land conflict at the site level. The village of Cantacunda share the same shallow with Sintcha Bobo, Sare WINS, Madina, Samba Sintcha, Sintcha Folonco and Sintcha Hoio.

The rice field has a usable area of more than 150 hectares and in topographic terms it has a homogeneous configuration, flat and well seated, which the average width exceeds not 250 meters. It is long and serves several villages, such as mentioned above.

At the village level, the site is supplied with fresh water by a watershed, with a Court of temporary water during the successive rains. Despite the no definition of bed surface runoff and stormwater drainage happens fast enough, even after heavy rains. According to the population encountered, the blade of water level can reach 15 cm, but after a few days this blade is completely drained. This situation worsens the deficit irrigation water and does not promote rice production.

The immediate slopes of the Valley are consisting of savannah grass (pasture area), so very susceptible to water erosion. This area contributes to the silting up of the rice fields.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The rice farmers cultivate the land using the technique "balinculo" used to fight weeds and for conservation of water. The technique used is sowed. The varieties used are: Guireghare, Banimalo, Sambaroconco, DEPA - 90 days; Hotchocoro, Sare Amadi, Sambanconco, Wancaran-120 days; Marlon, Mulai-60 days.

Cantacunda and nearby villages have a significant number of livestock. By the data of the regional veterinary service, for all of the villages, the number of livestock is estimated at 2,000 head of cattle. The watering of herds is done by manually digging water from a single drilling equipped with a manual pump and / or moving long distances to supply livestock with water.

The main constraints of rice and livestock production are: the decline in the fertility of the soil, the strong presence of weeds especially Striga, lack of equipment and inputs of post-harvest equipment, manual of herds watering and/or transhumance and the lack of support and technical guidance.

The main problems diagnosed in the village-site are the following:

- ✓ Siding of the rice fields
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season.
- ✓ Absence of knowledge of how to do the adoption of adaptation measures to tackle problems of water deficit for crop irrigation
- ✓ Absence of adequate infrastructure for livestock watering.

5.2.8. Site of Suna Nhamabé

The village of Sunna Nhamabé is located 3 km from Fajonquito and 6 km from the national Bafatá-Cabadjú (border Senegal) It is connected to Fajonquito by a narrow track and can be driven all year round. The village is medium-sized, with dozens of houses and a population of about 200 people.

Less than 500 meters from the village there is a shallow where women practice rice cultivation. The mode of acquisition of the land here is also by inheritance. Each family estate is known by the villagers and each family manages his land at the needs of all members. The land is not to be rent, but it can be loaned without interest. There is no land conflict at the site level. The village shares the same shallow with Sintchu, Sintcha Tenquenam, Sare Hamadi, Djarto, Mansidi, Sare dough and Sare Canta.

The rice field has a usable area of more than 150 hectares and in topographic terms, it presents a homogeneous, flat and well-seated configuration, the average width not exceeding 250 metres. It is long and serves several villages, such as mentioned above.

At the village level, the site is supplied with fresh water by a watershed, with a temporary stream during successive rainy. Despite the non definition of bed surface runoff and stormwater drainage happens fast enough, even after heavy rains. According to the population encountered, the blade of water level can reach 15 cm, but in two days this blade is completely drained. This situation worsens the deficit irrigation water and does not promote rice production.

The immediate slopes of the Valley are consisting of savannah grass (pasture area), so very susceptible to water erosion. This area contributes to the silting up of the rice fields.

The preparation of the soil is made manually by the majority of women. Some of them are supported by their husbands by plowing with animal-drawn ploughs. The rice farmers cultivate the land using the <balinculo> technique used to fight weeds and for conservation of water. The varieties used are: Guireghare, DEPA Contuboel, Cinco Male, Mulai Dimba Modadjo - 60 days. Banimalo-90 days</balinculo>.

Suna Nhamabé and neighboring villages have a large number of livestock. According to data from the regional veterinary service, for all the villages, the number of livestock is estimated at

2000 head of cattle. The watering of the herds is done by manual water extraction from a single drill equipped with a manual pump.

The main constraints of rice and livestock production are: the decline in the fertility of the soil, the strong presence of especially the Striga weed, the lack of inputs, equipment post-harvest, manual watering of herds and equipment and the lack of support and technical guidance.

The main problems diagnosed for the village / sites are as follows:

- ✓ Siding of the rice fields.
- ✓ Difficulties in retaining and managing floods to flood rice plots during the rainy season.
- ✓ Absence of knowledge of how to do the adoption of adaptation measures to deal with problems of water deficit for crop irrigation.
- ✓ Lack of adequate infrastructure for livestock watering.

VI. SYNTHESIS OF SITES DIAGNOSIS

The following table presents a summary of the identified sites.

Sites (sector)	geographical coordinates			Areas potential	Beneficiary villages	Type of intervention	Observation	cultivated rice varieties	Cycle days
	Village	Rice field	basin

Annex 5: Procedures to resolve a grievance in the framework of the project

Procedures to resolve a grievance

This manual defines the policy and guidelines at the company level on grievance. These guidelines include the following:

- **Filing of Application:** The affected party shall file an application with one resident missions or headquarters of BOAD for receipt of complaints. Upon receipt, the complaints will be transferred to the appropriate Organizational Unit at the Bank's headquarters.
- **Registration and acknowledgment of receipt of the request:** Within five working days of receipt of the request, the resident mission or relevant headquarters service logs the request and sends an acknowledgment to the applicant and a copy to the project sponsor and the Bank's headquarters.
- **Consideration of the admissibility of the application:** Within twenty working days of registration of the application, the Organizational Unit in charge of policy and grievance procedure at the headquarters of the Bank will inform the applicant and the public if the application meets the eligibility criteria.
- **Assessment of the feasibility of resolving the dispute:** Within twenty-five working days of the determination of the admissibility of the request, the Organizational Unit shall transmit to the applicant, the resident mission and other relevant stakeholders an assessment of the feasibility of grievance resolution activities. The evaluation will also include recommended actions, if any, that BOAD will be willing to undertake or facilitate to encourage the resolution of the dispute considered, or it will conclude on the inutility of the resolution of the dispute and will close the case. This assessment will also determine whether the applicant first must submit a request to one of the grievance process established by the project proponent or the government of the resident mission.
- **Obtaining consent for the resolution of the dispute:** Any dispute resolution efforts based on the consent of key stakeholders, including eg applicants, affected communities, the promoters of the project, the Government of the resident mission and / or the headquarters of the Bank. A dispute resolution process cannot move forward without the voluntary consent of the main parties.
- **Dispute resolution process:** Assuming that major stakeholders have agreed on a course of action to try to resolve their dispute or remedy the concerns of applicants, the grievance process will implement the agreed course of action. Some flexibility will be necessary as the appropriate approach will necessarily be adapted to the individual application and consent. In the absence of consent, the possibilities of dialogue and consultation will necessarily be reduced. If the consultation process works all parties can continue the process until an agreement is reached.
- **Obtaining or not an agreement:** Once complete the dispute resolution process, organizational unit responsible for compliance and regulation to the Bank will submit its report, including the settlement agreement (if applicable) and any recommendations for further action by BOAD to the President of the Institution and to all stakeholders.
- **Stopping the consultation process:** All parties to the consultation may at any time terminate the dispute resolution process if they are not in agreement with the adopted course of action. In certain circumstances, the consultation process will end with no resolution. In such circumstances, a detailed report will be submitted to the President of BOAD, summarizing the application, the measures taken to try to resolve the issues raised by the application, and recommendations for further action by BOAD, if applicable. This final report will also be forwarded to the Head of the resident Mission of BOAD concerned and the applicant, the project sponsor, the government of the country of the resident mission and the public. If for any reason the indicated timetable cannot be respected in a particular case, the applicant and the public will be informed of the delay, the reasons thereof and the new schedule. The person responsible for the grievance mechanism is the head of the Division of Compliance and Regulatory.

**Annex 6:

Annex 12: Law of Guinea Bissau on Land

Annex 12: Lei nº 5/98
de 23 de Abril

ARTIGO 2º
Da Propriedade da Terra

1. Na República da Guiné-Bissau a terra é propriedade do Estado e património comum de todo o povo.

2. A terra como suporte físico fundamental da comunidade é valor eminentemente nacional, qualquer que seja a forma da sua utilização e exploração.

3. Os direitos constituídos sobre a terra e sobre os recursos naturais importam em igual protecção quer resultem do costume, quer da lei.

4. As benfeitorias realizadas sobre a terra podem ser de propriedade pública ou privada.

Annex 13: Project operating account tables

Operating Account of 1 ha of Rice in Lowland areas (with project)

Item	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		0
1.2 Raw product	4000	kg		
1.3 Harvest loss and decoupling loss (20%)	800	Kg		0
Total net product (Husked rice)	3200	Kg	350	1120000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha		40000
Seed	125	kg	224	28000
Fertilizer				
• NPK	2	Bags de 50kg	16500	33000
• Urea				-
Pesticides	1	U	15000	15000
Workforce (90 HJ x 1500 FCFA / HJ i.e. 135 000 FCFA paid in husked rice - Contribution of beneficiaries for breeding, weeding, hoeing, Cortication, threshing, transport, etc.)	386	kg	350	135100
Small maintenance materials		FF		20000
Contribution to the maintenance of hydraulic appliances 5% net product (Husked rice)	160	kg	350	56000
Total Expenses				327100
Net result per hectare with the project	2265.43	Kg	350	792900
Result per hectare without the Adaptation Fund project				9750
Value added to the project through the application of adaptation measures				783150

Operating Account of 1 ha of Rice in Lowland areas (without project)

Item	Quantity	Unit	Cost per item	Values
I. Operating income				
1.1 Operating Acreage	1	ha		0
1.2 Raw product	600	kg		
1.3 Harvest loss and decoupling loss (20%)	120	Kg		0
Total net product (Husked rice)	480	Kg	350	168000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha		20000
Seed	75	kg	224	16800
Fertilizer				
• NPK	1	sacs de 50kg	16500	16500
• Urea				-
Pesticides	1	U	15000	15000
Workforce	257	kg	350	89950
Small maintenance materials		FF		0
Total Expenses				158250
Result per hectare without the project	27.86	Kg	350	9750

POTATO

Operating Account of 1 ha of Potato with project

Items	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		
1.2 Raw product	25,000	kg		
1.3 Harvest loss and decoupling loss (10%)	2500	Kg		
1.4. Self-Consumption (20%)	5000			
Total net marketable product	18,000	Kg	400	7200000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha	50000	50000
Seed	1	lot	900000	900000
Fertilizer				
• NPK	2	sacs de 50kg	16500	33000
• Urea				-
Pesticides	1	U	15000	15000
Workforce	630	H-J	1500	945000
Small maintenance materials		FF		40000
Contribution to the maintenance of hydraulic appliances 10% net product	1800	kg	200	360000
Total Expenses				2343000
Net result per hectare with the project	12142.50	kg	400	4857000
Result per hectare without the Adaptation Fund project				2901700
Value added to project through application of adaptation measures				1955300

Operating Account of 1 ha of Potato without project

Items	Quantity	Unit	Cost per unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		0
1.2 Raw product	10000	kg		
1.3 Harvest loss and decoupling loss (10%)	1000	Kg		0
Total net marketable product	9000	Kg	400	3600000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha		20000
Seed	75	kg	224	16800
Fertilizer				
• NPK	1	sacs de 50kg	16500	16500
• Urea				-
Pesticides	1	U	15000	15000
Workforce	630	H-J	1000	630000
Small maintenance materials		FF		0
Total Expenses				698300
Operating income per hectare without project	7254.25	Kg	400	2901700

TOMATO

Operating Account with project – Tomato (1 ha)

Items	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		
1.2 Raw product	24,000	kg		
1.3 Harvest loss and decoupling loss (10%)	2400	Kg		
1.4. Self-Consumption (5%)	1200			
Total net marketable product	20,520	Kg	300	6156000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha	50000	50000
Seed	1	lot	900000	900000
Fertilizer				
• NPK	1	sacs de 50kg	16500	16500
• Urea	1	sacs de 50kg	16500	16500
Pesticides	1	U	15000	15000
Workforce	630	H-J	1500	945000
Small maintenance materials		FF		40000
Contribution to the maintenance of hydraulic appliances 10% net product	2052	kg	200	410400
Total Expenses				2393400
Net result per hectare with the project	12542.00	kg	300	3762600
Result per hectare without the Adaptation Fund project				1461700
Value added to project through application of adaptation measures				2300900

Operating Account without project – Tomato (1 ha)

Items	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		0
1.2 Raw product	8000	kg		
1.3 Harvest loss and decoupling loss (10%)	800	Kg		0
Total net marketable product	7200	Kg	300	2160000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha		20000
Seed	75	kg	224	16800
Fertilizer				
• NPK	1	sacs de 50kg	16500	16500
• Urea				-
Pesticides	1	U	15000	15000
Workforce	630	H-J	1000	630000
Small maintenance materials		FF		0
Total Expenses				698300
Operating income per hectare without project	4872.33	kg	300	1461700

Operating Account with project – Onion (1 ha)

Items	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		
1.2 Raw product	23,000	kg		
1.3 Harvest loss and decoupling loss (10%)	2300	Kg		
1.4. Self-Consumption (5%)	1150			
Total net marketable product	19,665	Kg	300	5899500
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha	50000	50000
Seed	1	lot	900000	900000
Fertilizer				
• 15-15	100	kg	400	40000
• Urea	50	kg	400	20000
Pesticides	1	U	15000	15000
Workforce	630	H-J	1500	945000
Small maintenance materials		FF		40000
Contribution to the maintenance of hydraulic appliances 10% net product	1966.5	kg	200	393300
Total Expenses				2403300
Net result per hectare with the project	11654.00	kg	300	3496200
Result per hectare without the Adaptation Fund project				1461700
Value added to the project through application of adaptation measures				2034500

Operating Account without project – Onion (1 ha)

Items	Quantity	Unit	Cost per Unit	Values
I. Operating Income				
1.1 Operating Acreage	1	ha		0
1.2 Raw product	8000	kg		
1.3 Harvest loss and decoupling loss (10%)	800	Kg		0
Total net marketable product	7200	Kg	300	2160000
II. Expenses				
2.1 Operating Expenses				
Ploughing and Other Soil Preparation	1	ha		20000
Seed	75	kg	224	16800
Fertilizer				
• NPK	1	sacs de 50kg	16500	16500
• Urea				-
Pesticides	1	U	15000	15000
Workforce	630	H-J	1000	630000
Small maintenance materials		FF		0
Total Expenses				698300
Operating income per hectare without project	4872.33	Kg	300	1461700

OPERATING INCOME OF THE PROJECT PER CROP

Operating Account -Rice		
	For 1 ha	For 1362 ha
Operating income with project	792,900	1,079,929,800
Operating income without the Adaptation Fund project	9,750	13,377,000
Value added to the project through application of adaptation measures	783,150	1,066,552,800

Operating Account - Potato		
	For 1 ha	For 200 ha
Operating income with project	4,857,000	971,400,000
Operating income without the Adaptation Fund project	2,901,700	580,340,000
Value added to the project through application of adaptation measures	1,955,300	391,060,000

Operating Account – Tomato		
	For 1ha	For 100 ha
Operating income with project	3,762,600	376,260,000
Operating income without the Adaptation Fund project	1,461,700	146,170,000
Value added to the project through application of adaptation measures	2,300,900	230,090,000

Operating Account - Onion		
	For 1ha	For 100 ha
Operating income with project	3,496,200	349,620,000
Operating income without the Adaptation Fund project	1,461,700	146,170,000
Value added to the project through application of adaptation measures	2,034,500	203,450,000

SUMMARY OF THE OPERATING INCOME OF THE PROJECT WITH THE 1 762 HA

	Rice	Potato	Tomato	Onion	Total
Operating income with project	1,079,929,800	971,400,000	376,260,000	349,620,000	2,777,209,800
Operating income without the Adaptation Fund project	13,377,000	580,340,000	146,170,000	146,170,000	886,057,000
Value added to the project through application of adaptation measures	1,066,552,800	391,060,000	230,090,000	203,450,000	1,891,152,800

ASSUMPTIONS

Basic data on crop yields per hectare

Speculation	Yield without project (kg/ha)	Yield with the Adaptation Fund project (kg/ha) *
Rice	600	4000
Potato	10000	25,000
Onion	8000	23,000
Tomato	8000	24,000

* Data retrieved from the Directorate-General for Agriculture of Guinea Bissau

Post-harvest loss

Speculation	Post-Harvest loss
Rice	20%
Potato	10%
Onion	10%
Tomato	10%

Producers Self-Consumption

	Quantities after post-harvest losses	Percentage self-consumed
Speculation	kg	%
Rice	3,200	60,9%**
Potato	22,500	20%
Onion	20,700	5%
Tomato	21,600	5%

** It is expected that instead of selling rice product, the beneficiaries use their own production to ensure their food security in rice. 60.9% of the production are reserved for this purpose.

Market Selling prices for products in Guinea-Bissau (Basic scenario)

	Average Price***
Speculations	F CFA/Kg
Rice****	350
Potato	1000
Onion	300
Tomato	500

*** Data retrieved from the technical services of the Directorate-General for Agriculture in the project's intervention regions

**** It is the price of the imported rice, if we consider that the beneficiaries would have paid the complementary rice during the drought season. The price of the local rice is between 400 and 500 FCFA.

Annex 14 : Terms of reference (competencies and composition) of the Regional planning office

TERMOS DE REFERÊNCIA PARA GABINETE REGIONAL DE PLANIFICAÇÃO

I – Introdução

A planificação Regional pode ser entendida como um processo de coordenação e orientação das decisões de afectação dos recursos disponíveis com vista a uma eficaz concretização dos objectivos estratégicos de carácter socio-económico da região, tendo como instrumento o plano do desenvolvimento regional, que serve como um documento orientador de políticas, como suporte da intervenção dos diferentes actores no vertente socio-económico da região. O instrumento de planificação a que se refere, coaduna com um conjunto das determinações dentro do sistema de planificação de uma região.

Este processo desencadeia-se com sucesso, se existir uma estrita interacção entre os componentes do gabinete designadamente (Ministérios técnicos, autoridades políticas, organizações de base, etc.), com preocupações a diferentes dimensões no quadro das estratégias do desenvolvimento estabelecido.

II- Medidas para Criação do Gabinete

Na altura do Partido único (PAIGC), criou-se conselhos regionais. Estes conselhos regionais tinham a competência para a elaboração de programas e da definição das acções prioritárias para o Desenvolvimento Regional e Local. Estes programas são enviados e apresentados ao Governo Central, o qual lhe cabe determinar a prioridade das prioridades no âmbito da definição das estratégias de desenvolvimento socio-económico do País. No entanto, foi uma forma de desconcentração do poder da decisão, apesar que o Governo Central continua a tomar decisões relacionadas com as questões regionais.

Nos meados do ano 1980/81 efectivamente houve uma tentativa com ajuda do Governo Holandês implementar medidas de desconcentração, com vista ao reforço das capacidades das iniciativas e das estruturas administrativas locais. E ainda com a colaboração da DU de Alemanha, criou-se Delegacias do plano á nível das regiões no quadro de implementação dos projectos integrados. No ano 81/82 foram criados GPR na sequência de elaboração e implementação do 1º Plano Quadrienal que são dirigidos pelos Governadores Regionais e Apoiados tecnicamente pelos Delegados Regionais do Plano.

Estes deveriam funcionar como espaço de concertação, coordenação, Identificação, aprovação, controle, seguimento e avaliação de forma crítica das acções do desenvolvimento das regiões.

III--Objectivos Gerais

Os objectivos fundamentais que visam a criação do Gabinete de Planificação Regional são:

- Assegurar uma boa localização dos projectos com intuito de atingir o desenvolvimento sustentável da região concernente;
- Definir quais os projectos a iniciar e onde localizá-los optimamente, tendo em conta os objectivos do desenvolvimento fixados pelo País;
- Seleccionar os projectos prioritários na medida do possível, tomando em consideração as estratégias da política do desenvolvimento da região;
- Harmonizar a localização dos projectos de Desenvolvimento em relação aos recursos físicos e a população da região;
- Apoiar as autoridades regionais administrativas na elaboração do seu próprio Plano do Desenvolvimento;
- Velar pela utilização coerente dos fundos destinados aos projectos, ONG's e Associações de Base;

- Considerar veementemente a repartição espacial do território, evitando dos eventuais agravamentos ou desequilíbrios;
- Dinamizar e reactivar os GPR;
- Inteirar da mobilização e utilização das receitas pública da região;
- Promover o reforço de capacidades dos quadros regionais;
- Harmonizar as políticas do desenvolvimento regional com base nos Planos nacionais, DENARP e OMD.

IV- Funções

As funções dos Gabinetes Regionais de Planificação em linhas gerais são seguintes:

1. Análise dos projectos contidos nos Planos Nacionais a partir do ponto de vista do desenvolvimento regional, que pela norma estabelecida, cada projecto de âmbito regional deve passar pelo Gabinete de Planificação Regional da Região concernente, antes de ser submetido para o PIP (Programa de Investimento Público) ou uma solicitação de financiamento;
2. Identificação e acompanhamento da execução dos projectos contidos no Plano Nacional a fim de apoiá-los e adequá-los de melhor forma possíveis as realidades locais;
3. Os GPR capacitar-se-ão para elaboração verdadeira e estratégica dos projectos do desenvolvimento, as quais deverão ser harmonizadas e adequadas aos Planos Nacionais e as Políticas Ministeriais de desenvolvimento para as regiões;
4. Assegurar os trabalhos da Coordenação, Seguimento e Avaliação das Acções Programadas numa perspectiva de coerência a nível das regiões;
5. Apoiar as autoridades regionais na elaboração dos Planos do Desenvolvimento das regiões inspiradas no DENARP e OMD e conforme as realidades específicas de cada região.

Gabinete Regional de Planificação (GRP) – É o órgão consultivo para intervenção de diferentes actores no processo de desenvolvimento das regiões.

V- Composição dos Gabinete Regional de Planificação (GRP)

Ele é composta por:

- Presidente (Governador Regional);
- Secretário Executivo (Diretor Regional do Plano e Estatística);
- Secretário do Gabinete Regional de Planificação (Secretário Administrativo Regional);
- Direcção Regional da Educação;
- Direcção Regional de Saúde;
- Direcção Regional de Agricultura;
- Delegacia Regional de Luta Contra a Pobreza;
- Delegacia Regional dos Recursos Naturais;
- Direcção Regional de Comércio;
- Delegacia Regional de Obras Publicas, Construção e Urbanismo;
- Delegacia Regional das Finanças;
- Delegacia Regional de Turismo e Artesanato;
- Delegacia Regional da Energia;
- Delegacia Regional das Pescas da zona Leste;
- Delegacia Regional da Justiça;
- Delegacia Regional de Registo Civil;

- Delegacia Regional da Juventude Cultura e Desporto;
- Delegacia Regional da Viação e Transporte;
- Delegacia Regional de Meteorologia;
- Delegacia Regional da Viação e Transporte;
- Delegacia Regional de Meteorologia;
- Guarda-fiscal Regional;
- Outros Ministérios técnicos sedeados na região;
- Representante das ONG's Nacionais e Estrangeiras;
- Representante de Instituto de Mulher e Crianças;
- Representante de Comunicação Social.

Para as reuniões alargadas do GPR, deve-se contar com as seguintes presenças:

- Sociedade Civil (representante);
- Representante de Entidades Religiosas;
- Representante de Anciões;
- Representante de Sociedade Tradicional.

VI- Funcionamento

O GRP funciona como a seguir se apresenta:

- O GRP é presidida pelo Governador da Região que é o Presidente da GRP, em caso da sua ausência, é assegurada pelo Secretário Executivo;
- As Delegacias, Direcções, Representações, Coordenações participam na reunião como membros do GRP e podem ser atribuídos qualquer tarefa;
- Nas reuniões de GRP, os membros efectivos podem ser acompanhados por seus adjuntos, quando for necessário
- A ausência de um membro efectivo numa reunião do GRP, pode delegar o seu adjunto o qual se considera como membro ao GRP, para a referida reunião;
- O GRP reúne-se ordinariamente de 2 em 2 meses e extraordinariamente sempre que necessário sob a convocatória do seu Presidente ou ainda por 2/3 dos seus membros efectivos;
- Uma reunião constituirá quórum quando a plenária é constituída por 2/3 dos seus membros em pleno gozo dos seus direitos;
- As decisões são tomadas pela maioria ou 2/3 dos seus membros em pleno gozo dos seus direitos;
- As resoluções finais de cada encontro do GRP devem ser lida e aprovada no final do encontro;
- As actas de cada encontro devem ser apresentados e submetidos para a aprovação no inicio de cada reunião;
- As despesas de funcionamento são asseguradas pelo Comité de Estado da Região;
- O Ministério da Administração Territorial deve responsabilizar-se com o fornecimento dos materiais didácticos contando com o apoio técnico da Secretaria de Estado do Plano e Integração Regional.

VII- Competências

Compete ao GRP:

- Convidar outras pessoas para assistir as suas reuniões sem serem membros em pleno gozo dos direitos;
- Estudar e dinamizar as orientações básicas sobre as estratégias do Desenvolvimento Regional;

- Acompanhar a execução do Plano Nacional na região, elaborando relatório sobre andamento das actividades;
- Receber relatório das actividades de todas instituições Governamentais e ONG's e Associações de Base para a sua análise pormenorizada;
- Identificar, Formular, implementar e supervisionar projectos de desenvolvimento na região, micro-projectos e/ou micro realizações e dar a assistência as tabancas mais carenciadas;
- Aprovar as actas e resoluções finais das reuniões realizadas;
- Solicitar qualquer organização Governamental, ONG's e Associações de Base para o esclarecimento de qualquer entrave;
- Assegurar a coordenação e harmonizar as actividades das diferentes instituições na região.

VIII- Competências do Presidente do GRP

a) Compete ao PGRP:

- Presidir as reuniões de GRP;
- Analisar e aconselhar sobre algo que possa favorecer o desenvolvimento harmonioso do GRP;
- Zelar no máximo para que haja um normal funcionamento do GRP e do cumprimento do regulamento interno;
- Comunicar o Secretário Executivo para convocação das reuniões de GRP sempre que for necessário.

b) Competências do Secretário Executivo:

Compete-lhe:

- Convocar as reuniões do GRP, com a comunicação prévia do Presidente; a convocação e presidência lhe compete em caso de ausência do Presidente;
- Apoiar o Presidente do GRP na orientação dos trabalhos de GRP;
- Manter contacto permanente com a Secretaria de Estado do Plano e Integração Regional a fim de lhe fazer inteirar dos trabalhos do GRP;
- Concertar sempre que necessário com o Presidente do GRP.

c) Competências do Secretário do GRP:

Compete-lhe:

- Preparar as propostas de ordem do dia para cada reunião do GRP em colaboração com o Secretário Executivo sob a orientação do Presidente;
- Elaborar e compilar as actas e proceder a sua distribuição atempada (15 dias) para os membros efectivos do GRP e outros individualidades assim que for necessário;
- Proceder a leitura da acta da reunião anterior no princípio de cada reunião;
- Proceder a leitura das resoluções finais no fim de cada reunião;
- Preparar e organizar os documentos que o GRP lhe designa.

Por: DDR

Annex 15: Action plan for integrated pests and pesticides management

Action Plan for implementation of Integrated Pests and Pesticides Management of the project

The action plan for implementation of Integrated Pests and Pesticides Management (PGIPP) of the project includes: (i) a integrated pest and pesticide management approach for the project; (ii) principles of intervention; (lii) strengthening the legislative framework for pesticide management; (iv) capacity building of actors through training (v) sensitization for the promotion of the use of alternatives control strategies; (vi) good practices to be adopted during the pesticide management cycle; (vii) measures to be taken in the event of poisoning; (viii) the monitoring-evaluation plan; and (ix) institutional arrangements for the follow-up of the PGIPP.

a) Approach to Pests and pesticides management in the implementation of the project

Integrated Pest Management (IPM) is concerned with a holistic approach towards pest control techniques, aiming to keep pesticide applications and other interventions within economically justified levels while minimizing any risks (real or potential) to human health or the environment. Natural pest control plays a significant role in IPM, and includes direct and indirect measures (see table below). The present project on Climate-smart agriculture aims to significantly reduce chemical pesticide application already indirectly, where many activities – use of crops adapted to local conditions, reliance on appropriate yield expectations, use of resistant varieties, optimal densification of cultivars, etc. – overlap with indirect plant protection³².

The option for the promotion of integrated pest and pesticide management in the framework of the project is made to avoid or considerably reduce the use of chemical pesticides. In case of parasite attack, the least hazardous methods will be preferred. Chemical pesticides will be used in extreme cases where less dangerous methods will prove ineffective. In this case, the choice of use of chemical pesticides will be made in accordance with the recommendations of the integrated pest and pesticide management plan. Given that Guinea Bissau does not have sustained experience in integrated pests and pesticides management, it is very important to take into account, the experiences and lessons learned of the FAO in the pests and pesticides integrated management in the Africa's subsaharian countries. It is why, the members of National committee of pest and pesticides management (CNGP), the DPV officers, the PMU, the NGO's representatives in charge of the supervision of beneficiaries on the perimeters will be trained on the integrated management of the pests and pesticides in the project area by an Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries (Please see item d) below). This expert will be recruited by the PMU under the supervision of the Implementing Entity.

At the end of the training sessions, a box of integrated pests and pesticides management tools will be made available to the beneficiaries, the DPV, the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions. *These tools box prepared by the Expert with the FAO experiences in the integrated pests and pesticides management, will indicate the appropriate actions to take on the various pests and pesticides. The tools box will also indicate the limited WHO class U and III pesticides*

³² See Climate-Smart Agriculture Sourcebook: FAO, 2013

that the beneficiaries can use if the agronomic, cultural, mechanical and biological methods prove to be ineffective in dealing with the problem.

The following approach will ensure coordinated and sustainable management of pests and pesticides in the project framework.

Step 1: Dissemination of pest management alternatives

The alternatives to pesticides as agronomic, cultural, mechanical and biological control will be disseminated for better use by the producers. The resistant seed will be promoted also. This actions will be integrated early the sites or crop development to prevent the attack by pests. The box of integrated pests and pesticides management tools elaborated following the training by IPM Expert will be made available to the beneficiaries.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building on integrated pest and pesticides management.

Step 2 : When an attack of crops by pests is observed on a site, the beneficiaries will use, under the control of the site facilitator and the project regional coordinator, the appropriate alternatives retained in the IPM tools prepared with the support of the IPM Expert on which the beneficiaries, the facilitators and the project regional coordinators have already received training. These alternatives measures will be applied in a spirit of environmental protection and human health. The project regional coordinator will inform the PMU on the adequate actions taken on the perimeter by the beneficiaries to end the attack of pests.

Step 3 : In extreme cases, where alternatives actions will prove ineffective, the regional directorate of DPV, who have also received training from the IPM Expert, will advise the PMU on the need for limited class III or U pesticides purchases. The use of the WHO class III and U pesticides by the beneficiaries will be done with the support of PMU under the control of the DPV. The National Pesticide Management Committee³³ (CNGP) will be informed by the DPV and the PMU will inform the BOAD on the process.

The possible alternatives for chemical pest control which can be used in the framework of the project are presented in the table below :

³³To overcome the problems associated with the uncontrolled use of pesticides and to reduce the risks associated with the use of poor quality pesticides, a National Pesticide Management Committee (CNGP) is set up in Guinea Bissau, Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations, customs. The CNGP ensures, inter alia: (i) the implementation and monitoring of compliance with pesticide quality control procedures and standards; (ii) post-registration control of pesticides; (iii) compliance monitoring of pesticides; Control of the distribution and use of pesticides; (iv) control of Maximum Residue Limits (MRLs) of imported products for local consumption; (v) control of professionals in the pesticide industry; (vi) Maintaining the register of operators in the sector; (vii) the maintenance and updating of registered pesticides; (viii) denunciation of unauthorized pesticides entering the country; (ix) monitoring of toxicovigilance; (x) monitoring of pre-extension trials; (ix) monitoring the implementation of international pesticide conventions.

Indirect plant protection	Monitoring and forecasting	Direct plant protection
<p>Optimal use of natural resources:</p> <ul style="list-style-type: none"> • Use crop adapted to local conditions • Rely on appropriate yield expectations • Use of resistant varieties • Weed management with adequate intensity of competition • Adequate mixtures of varieties and crops • Optimal timing of sowing period • Training on pest and appropriate pesticides, particularly biological options, and importance of ecological compensation areas <p>Use of farming practices without negative impact on the agro-ecosystems:</p> <ul style="list-style-type: none"> • No use of surplus input of nutrients (especially N); • Optimal density of crop and foliage to facilitate ventilation • Low intensity of tillage/cultivation and production methods protecting soil fertility • Weed management for erosion control • Biodiversity conservation and protection to enhance biodiversity, therefore reducing pest incidence • Where adequate protection and augmentation of beneficial biological antagonists. 	<ul style="list-style-type: none"> • Monitoring and forecasting of pest incidence will be done in accordance with the project's IPM plan. • No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building on integrated pest and pesticides management. 	<p>Use of selective pest control methods:</p> <ul style="list-style-type: none"> • Wherever and whenever adequate, reliance on biological control, biopesticides, etc. <p>Chemical pest control methods, only where other options are failing or will be very likely:</p> <ul style="list-style-type: none"> • Preference for the most specific and selective pesticides (class III and U of WHO) • Preference for least harmful and least toxic pesticides (class III and U of WHO)

b) Principles for intervention

The management of pests and pesticides in the project should address the following principles:

- Caution and attention;
- Strengthening the capacities of stakeholders on integrated pests and pesticides management;
- Traceability of the products used;
- Coordination and intersectoral cooperation;
- Information and management of data relating to the integrated management of pesticides;
- Rationalization and strengthening of supervisory structures and risk prevention;

- Monitoring and evaluation ;
- Monitoring of health and environmental impact;
- Effectiveness of the participation of all stakeholders;
- Promotion of integrated pest management in extension / producer information systems (for integrated pest management, the 16 internationally recognized core principles will be implemented, annex 3 of this document).

c) Strengthening the legislative framework for pesticide management

It consists to :

- Promote incentives measures to encourage the use of agronomic, cultural, mechanical and biological pest control methods to significantly reduce the use of chemical pesticides ;
- Vulgarize the integrated pest and pesticides management.

d) Strengthening technical capacities on integrated pest and pesticide management

The project will organize capacity-building sessions on integrated pest and pesticides management for actors involved in the project. The capacity building will be focused on alternatives to pesticides as agronomic, cultural, mechanical and biological control. These are the techniques or actions that are taken into account in crop development to prevent pest outbreaks and avoid or greatly reduce the use of chemical pesticides (alternatives of chemical pesticides use are presented in integrated pest management approach at the page 123 of this document). The capacities building on integrated pest and pesticides management will concerned at least the following institutions and individuals: Regional Directorate for Plant Protection, National committee of pest and pesticide management (CNGP in French)³⁴, Regional Directorate for Environment and Sustainable Development, Regional Directorate for Agriculture, Regional Directorate for agriculture water infrastructures management, representative of the Governorate of the Region, Competent Authority for Environmental Assessment (AAAC in French) , Regional Directorate for Public Health, National Laboratory for Agrarian Research (INPA in French), Members of Perimeters' Management Committee, NGO's representatives in charge of the supervision of the beneficiaries on sites, the PMU and the presidents and administrators of the perimeters will be trained on the integrated management of pests and pesticides.

This training will be conducted by an Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries. This expert will be recruited by the PMU under the supervision of the Implementing Entity on the basis of a shortlist of Experts recommended by the FAO office based in Rome (Italy) and or in West Africa in Accra (Ghana).

At the end of the training sessions, the tools box of integrated pests and pesticides management will be made available to the beneficiaries, the DPV, the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

³⁴ The National pest and pesticide management committee (CNGP) is set up in Guinea Bissau by the Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations and customs.

e) Sensitization for the promotion of the use of alternative control strategies

It consists to:

- Strengthen the exchange of information on the alternatives on pest management and their benefit for environment, health and crop production;
- Make known to producers and other stakeholders, through sensitization, risks and impacts related to use, storage, transport, distribution/ marketing, handling of chemical pesticide;
- Sensitize, educate and inform producer groups on the judicious use of pesticides (in cases where the use of pesticides is necessary. Class III and U pesticides being the only ones that can be used in the project);
- Sensitize producer groups on hazards and good hygiene practices in the use of pesticides;
- Raise public awareness of the protection of people vulnerable to pesticides;
- Actively involve civil society in information / education / communication on pesticide management.

Information and awareness-raising strategy for users and the general public

Awareness-raising should aim to popularize pests integrated management methods and even very effective traditional methods of fighting insect pests.

Indeed, information and awareness about environmental and health risks are very little advanced in the country. Long-term strategies and effective approaches are needed to inform and sensitize all stakeholders by focusing on the following areas of intervention:

- develop and disseminate tools box on the various risks in the use of pesticides and good practices of integrated pest and pesticides management as alternatives;
- sensitizing actors through radio and television debates for promoting integrated pest and pesticides management ;
- provide support to trade unions operating in the various sectors concerned to raise awareness among their members on the occupational risks associated with chemicals in their respective fields;
- support consumer associations in raising awareness among the general public;
- strengthen the training of rural supervisors and extend their activities through rural radio stations;
- set up a national commission and local standards committees in both agricultural and industrial production;
- get closer to the chemical safety committee on chemicals.

Information and awareness programs are essential to reduce the risk of pesticide disease and poisoning and ultimately lead to real change in behavior.

f) Good practices to be adopted during the pesticide management cycle in the extreme case of use of WHO class III and U pesticides

In the framework of the project, agronomic, cultural, mechanical and biological methods of integrated pest management will be used. If these measures prove ineffective in the face of the problem that persists, only WHO class III and U pesticides may be used. In this case, some of the best practices to be applied in the cycle of use of these pesticides of class III and U include: (i) transport and handling; (ii) storage; (iii) maintenance of the equipment to be used; (iv) preparation of the pesticide slurry; (v) application of the pesticide slurry; (vi) bottom of vats or containers (or residue of slurry); (vii) management of packaging; (viii) termination of application.

g) Measures to be taken in cases of poisoning

In the project framework, agronomic, mechanical and biological methods are been promoted. When these measures are ineffective, the WHO Class III and U pesticides should be used. These Class III and U have little effect on human health in case of normal use. However, in case of poisoning appropriate care will be provided to the victims. If the situation is of concern, the victim will be evacuated to a health center in the area that has received training in pesticide poisoning management. A table showing some of the signs of intoxication and primary care to be provided before the evacuation of a victim, if necessary is prepared (refer to the PGIPP).

h) Monitoring and Evaluation

The monitoring plan is subordinate to the activities planned under the project. Monitoring is supported by the collection and analysis of data to verify whether the implementation of the activities is proceeding as planned and to make immediate adjustments if necessary. It is therefore a short-term evaluation activity to allow for real-time action. The frequency of monitoring will depend on the type of information required, however it will be continuous throughout the implementation of the project.

The overall monitoring will be ensured by the structures put in place for the implementation of the project. It will be organized through periodic field visits.

In order to do so, monitoring indicators have been established in relation to the above measures proposed in the implementation plan for the PGIPP.

In addition to the annual pest and pesticide management assessments that will allow continuous improvement of the implementation of the PGIPP, a mid-term evaluation will be conducted at the end of the second year of implementation and another at the end of the project.

i) Institutional arrangement for the PGIPP monitoring

In Guinea Bissau, three technical ministries are mainly concerned with the management of pests and pesticides:

- (i) the Ministry of Agriculture through the DPV, for pesticides used in agriculture;
- (ii) the Ministry of the Environment and Sustainable Development, which is responsible for all chemicals, including pesticides and the framing of measures of their impact on the environment; and
- (iii) the Ministry of Public Health, responsible for the treatment of cases of poisoning by pesticides including those used in public health).

In the framework of the present project, the monitoring of the integrated pest and pesticide management plan will be the responsibilities of the DPV and the AAAC. According to their attributions, the institutions below will support the DPV and AAAC:

- the Regional Directorates for Plant Protection;
- the National committee on pesticides management (CNGP);
- the Regional Directorates for Environment and Sustainable Development;
- the Regional Directorates of Agriculture;
- the Regional Directorates of Public Health;
- the representatives of the Governorate of the region
- the civil protection service;
- the National Laboratory for Agrarian Research (INPA);
- the representatives of NGOs.

The BOAD, the implementing entity will assess the implementation of the PGIPP measures through the periodic reports submitted by the PMU and its field verification missions. The Implementation Entity's annual report will include a section on the implementation of the PGIPP in the framework of the implementation of the Project Environmental and Social Management Plan. In addition to the annual pest and pesticide management assessments that will allow continuous improvement of the implementation of the PGIPP, a mid-term evaluation will be conducted at the end of the second year of implementation and another at the end of the project.

The different actions proposed in the integrated pest and pesticides management plan are integrated into the project components and their costs into the project budget.

**Letter of Endorsement by Government
Government of Guinea Bissau**

Bissau, 13th September, 2017

To : The Adaptation Fund Board
C/o Adaptation Fund Board Secretariat
Email: Secretariat@Adaptation-Fund.org
Fax: 202 522 3240/5

Subject: Endorsement for Project "Scaling up climate-smart agriculture in East Guinea Bissau".

In my capacity as Designated Authority for the Adaptation Fund in Guinea Bissau, I confirm that the above project proposal is in accordance with the Government's national priorities in implementing adaptation activities to reduce adverse impacts of, and risks, posed by climate change in Guinea Bissau.

Accordingly, I am pleased to endorse the above project proposal with support from the Adaptation Fund. If approved, the project will be implemented by Banque Ouest Africaine de Développement (BOAD) and executed by General Directorate of Environment/ State Secretariat of Environment of Guinea Bissau.

Sincerely,

Mr. Viriato Luis SOARES-CASSAMA

RÉSUMÉ NON TECHNIQUE

L'agriculture Est Bissau guinéenne fait face à des contraintes climatiques qui se manifestent par des sécheresses compromettant les efforts des agriculteurs. Les projections faites dans le cadre du PANA, montrent que ce secteur sera davantage vulnérables en ces termes : (i) 20 à 30% de la baisse des rendements des cultures agricoles affectant plus particulièrement les produits horticoles, céréales (riz et millet), arachides et noix de cajou, en raison de la sécheresse, des hautes températures, une mauvaise répartition des pluies ; (ii) un tiers (33%) des populations sont submergées par l'insécurité alimentaire ; (iii) l'aggravation du déficit céréalier, en particulier le riz ; (iv) l'augmentation de la dépendance alimentaire du pays vis-à-vis du riz importé ; et (v) la détérioration des conditions de vie des populations, notamment rurales.

Bien que le pays dispose d'un potentiel en eau de surface non négligeable pour développer l'irrigation et faire face au déficit de pluies et/ou au dérèglement climatique, cette eau échappe à la technique du monde rural qui était appelé à la mobiliser pour des fins agricoles. C'est pour apporter un soutien au développement d'activités d'adaptation des populations face aux effets néfastes des changements climatiques à travers la mobilisation de l'eau pour l'irrigation et l'appui à la mise en valeur des périmètres que le présent projet "Agriculture intelligente face au climat dans l'Est de la Guinée Bissau" a été identifié. Le Project Concept Note (PCN) a été endossé par le Conseil d'Administration dudit Fonds par Décision B.27/9 au cours de sa 27^e réunion les 17 et 18 mars 2016 à Bonn en Allemagne pour un montant total de 9,979,000 USD à financer entièrement par le Fonds d'Adaptation.

Cependant, malgré la contribution que le projet pourra apporter au développement rural durable notamment le renforcement de la résilience de l'agriculture face aux effets néfastes des changements climatiques, le renforcement de la sécurité alimentaire et des conditions de vie de la population, sa mise en œuvre pourra engendrer des impacts négatifs et risques dont il convient d'analyser afin de prendre, en amont, des dispositions idoines.

Le présent Cadre de gestion environnementale et sociale (CGES) est ainsi élaboré pour permettre la mise en place d'un processus de sélection environnementale et sociale, afin d'identifier, d'évaluer et de proposer des mesures d'atténuation des impacts environnementaux et sociaux potentiels des activités du projet dès le stade de planification.

0.1. Le Projet

Le projet, tel que conçu, traitera des principales questions de vulnérabilités dans l'agriculture et de la gestion rationnelle des ressources en eau afin de contribuer au développement et à la résilience des besoins immédiats et à long terme des agriculteurs extrêmement vulnérables, avec un accent particulier sur les groupes extrêmement vulnérables notamment les femmes, les personnes âgées et les enfants. L'objectif global du projet est donc de contribuer à la résilience des populations face au changement climatique à travers une agriculture intelligente.

En lien avec la vulnérabilité du pays et les besoins d'adaptation identifiés, trois objectifs spécifiques sont poursuivis dans le cadre de ce projet:

1. Développer les capacités techniques et institutionnelles du gouvernement et de la société civile (secteur privé, communautés locales, ONG, etc.) pour faire face à l'augmentation du risque climatique dans la planification de l'adaptation au changement climatique;
2. Améliorer la résilience des systèmes de production agricoles existantes et contribuer à la diversification de la production, y compris la mise en œuvre d'un système de contrôle et de gestion de l'eau pour réduire au minimum les risques de sécheresses intenses et les inondations;
3. Promouvoir la diffusion des connaissances, des leçons apprises sur l'agriculture intelligente au climat et de la planification de l'adaptation à d'autres régions de la Guinée Bissau et à d'autres pays de l'Afrique de l'Ouest.

Ces objectifs s'inscrivent en droite ligne de ceux énoncés par le Fonds

d'Adaptation visant à "Réduire la vulnérabilité et accroître la capacité d'adaptation pour répondre aux impacts du changement climatique, y compris la variabilité au niveau local et national".

Le projet s'intègre également dans les documents de politique, stratégie et plan relatifs au développement de l'agriculture en Guinée Bissau, à la réduction de la pauvreté, au renforcement de la sécurité alimentaire et les capacités des populations à mieux s'adapter au changement climatique. Le projet s'intègre également dans la vision de développement 2035 de la guinée Bissau.

Pour atteindre les objectifs ci-dessus, le projet a été structuré en trois composantes hormis celle relative à la gestion du projet. Il s'agit :

- Composante 1. Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification
- Composante 2. Améliorer la résilience des systèmes de production agricole existants, y compris les mesures de contrôle et de gestion de l'eau
- Composante 3. La gestion des connaissances des enseignements tirés de l'agriculture intelligente face au climat et à la planification de l'adaptation

L'exécution de ces composantes et leurs activités va générer des impacts positifs et des impacts négatifs et risques environnementaux et sociaux dont il convient d'analyser afin d'inscrire le projet dans un contexte de durabilité.

0.2. Objectifs du CGES

Le Cadre de gestion environnementale et sociale (CGES) est conçu comme un mécanisme de tri pour les impacts environnementaux et sociaux des investissements et activités inconnues avant l'évaluation du programme. Il se présente donc comme un instrument servant à déterminer et évaluer les impacts environnementaux et sociaux potentiels futurs des activités ou composantes devant être financées par le projet.

Ainsi les objectifs du présent CGES sont : (i) d'établir un cadre pour déterminer, analyser et évaluer les impacts environnementaux et sociaux potentiels des investissements et activités à financer ; (ii) de définir le cadre d'identification des

mesures d'atténuation et de suivi ainsi que des mesures institutionnelles et de renforcement des capacités à prendre en compte durant la mise en œuvre du Projet pour soit éliminer les impacts environnementaux et sociaux adverses soit, renforcer les impacts positifs ; et (iii) de définir les modalités institutionnelles pour la mise en œuvre du CGES.

À ce titre, il sert de guide à l'élaboration des Etudes d'impact environnemental et social (EIES) des sous-projets qui seront retenus en vue de concevoir définitivement une étude d'impact environnemental et social avec un plan de gestion environnementale et sociale du projet.

0.3. La zone du projet

Le projet interviendra principalement dans les régions de Bafatà et de Gabù, et concentrera les activités le long des zones alluviales (vallées, bas-fonds ou zones dépressionnaires) où se sont développées des initiatives des groupements, des coopératives, des familles d'agriculteurs ou de microgroupes (souvent de femmes).

La population cible du projet est de façon directe la population des villages rattachés aux sites d'intervention du projet. De façon indirecte, les populations des secteurs administratifs de Pitche, Pirada, Gabú, Sonaco, Contuboel et Ganadu sont concernées.

0.4. Le cadre politique, juridique et institutionnel

L'étude prend en compte la Politique environnementale et sociale du Fonds d'Adaptation et les principes environnementaux et sociaux. Le cadre politique national en matière de gestion de l'environnement est consacré par la Loi N°1/2011 du 2 mars 2011 portant Loi de base sur l'environnement.

Au plan juridique, plusieurs textes internationaux et nationaux adoptés par la Guinée Bissau, et traitant spécifiquement de la protection de l'environnement vont s'appliquer au projet. Au plan international, il s'agit de :

- la Convention sur la diversité biologique ;
- la Convention sur les changements climatiques ;

- la Convention relative aux zones humides d'importance internationale particulièrement comme habitat des oiseaux d'eau, dite « convention RAMSAR » ;
- la Convention sur la conservation des espèces migratrices appartenant à la faune sauvage dite "Convention de Bonn", signée à Bonn (Allemagne) ;
- Convention de Stockholm sur les Polluants Organiques Persistants
- Convention de Bâle sur le contrôle des mouvements transfrontières de déchets dangereux et leur élimination
- Convention africaine sur la conservation de la nature et des ressources naturelles
- Convention phytosanitaire pour l'Afrique
- Convention phytosanitaire pour l'Afrique au sud du Sahara
- Convention de Bamako sur les déchets dangereux
- Convention de Rotterdam ;
- Convention Internationale pour la Protection des Végétaux

Au plan national, les obligations et dispositions législatives et réglementaires de protection de l'environnement applicables au projet, sont :

- Constitution de la République de la Guinée Bissau, adopté en 1984 et amendé en 1991, 1993, 1996
- Loi sur l'Évaluation Environnementale approuvée par le Gouvernement, lors de la séance du Conseil des Ministres du 19/03/08 ;
- Loi Forestier approuvé à travers le Décret-loi n° 4-A/91 et publié le 29 octobre 1991,
- Loi sur la Faune, approuvé par le Décret-loi n° 2/2004 et publié le 14 juin 2004,
- Ordonnances n°045/PRG/87 : Code de la protection et de la mise en valeur de l'environnement

Au plan institutionnel, l'exécution de la politique de protection et de gestion de l'environnement pour un développement durable est sous la responsabilité d'une multitude d'acteurs dont :

- le Ministère de l'environnement
- le Ministère de l'agriculture et du développement rural

- le Ministère de l'énergie et des ressources naturelles
- le Ministère de l'Élevage ;
- le Ministère de l'Hydraulique et de l'Assainissement ;
- le Ministère de la Santé Publique ;
- le Ministère en charge de la protection civile ;
- etc.

0.5. Le Mécanisme de consultations publiques

Ce chapitre présente la démarche de communication adoptée dans le cadre de cette étude afin de tenir informés les principaux acteurs du projet. Cette démarche de communication et de participation s'intègre directement à l'évaluation environnementale et sociale du projet.

L'étude a été réalisée sur la base d'une approche méthodologique participative qui s'est appuyée, d'une part, sur des visites de terrain, et d'autre part, sur les entretiens avec l'ensemble des acteurs et bénéficiaires du projet. Il s'agit notamment des : Gouverneurs de régions, des Administrateurs de secteurs, des services techniques, des populations locales, etc. Ces consultations publiques se sont déroulées en plusieurs phases dans les régions couvertes par le projet et dans les villages dont les sites potentiels ont été identifiés :

- une première consultation a été menée lors de la préparation de la note conceptuelle du projet (PCN);
- une seconde consultation lors de l'étude sur les leçons apprises du projet LDCF en cours d'achèvement;
- une troisième lors de l'identification des sites potentiels du projet; et
- Une quatrième lors de la préparation du Full Project.

La technique d'animation utilisée a permis d'orienter les débats vers l'expression des attentes et des préoccupations que les activités envisagées pourraient éventuellement soulever.

0.7. Les Impacts du projet

On distingue des impacts positifs et des impacts négatifs.

- Impacts positifs

Les impacts positifs de la mise en œuvre du présent sous-projet sont importants et diversifiés pour le groupement et la communauté nigérienne. Ils sont d'ordre environnemental et socio-économique.

Au plan environnemental, il s'agit de : la gestion durable des ressources en eau, l'amélioration de la qualité des sols, l'amélioration de la gestion des ressources naturelles à travers le renforcement de capacités en matière de lutte contre les feux de brousse.

Au plan socio-économiques, il s'agit de : la création d'emplois, l'amélioration de la production, des revenus et les conditions de vies des agriculteurs, l'amélioration de la nutrition infantile et de la sécurité alimentaire, l'accroissement des capacités des acteurs pour le développement et la mise en œuvre des approches résilientes aux effets néfastes des changements climatiques, etc.

- Impacts négatifs et risques E&S

La partie ci-après donne une synthèse succincte des impacts négatifs et risques liés à la mise en œuvre du projet suivant les principes E&S du Fonds d'Adaptation :

- la faible intégration des enjeux environnementaux et sociaux relatives aux principes du Fonds d'Adaptation dans la préparation des EIES des sous-projets
- la faible capacité des producteurs pour la mise en œuvre des mesures environnementales et sociales, conformément à la législation nationale et aux principes environnementaux du Fonds d'Adaptation;
- le risque du travail des enfants en dehors des limites fixées par la loi;
- le risque lié à la santé et la sécurité des travailleurs durant la mise en œuvre des activités sur les sites;
- la destruction de la végétation et l'habitat faunique pour l'implantation des ouvrages d'irrigation;

- le risque de dégradation de la qualité de l'eau et du sol en cas de non maîtrise de l'application des engrais et pesticides;
- la disparition de certains éléments de la biodiversité par l'utilisation incontrôlée de pesticides;
- la contamination des sols et des eaux par des produits chimiques;
- le risque d'intoxication par l'inhalation ou par la consommation d'eau ou d'aliments contaminés par des pesticides;
- le risque de développement de maladies d'origine hydrique du fait de la rétention de l'eau pour l'irrigation;
- le risque de destruction du patrimoine physique durant les découvertes fortuites;
- le risque de limiter la disponibilité de l'eau en aval des périmètres aménagés.

0.8. Les mesures d'atténuation et de bonification

Les mesures d'atténuation et de bonification suivantes ont été définies en rapport avec les impacts négatifs et risques environnementaux et sociaux du projet et des impacts positifs. Ces mesures ont été identifiées par phase du projet :

a) Phase de préparation

- Conduire les EIES des sous-projets sur la base des 15 principes du Fonds d'Adaptation ;
- Organiser des sessions de formation sur la gestion environnementale du projet et les principes du Fonds d'Adaptation à l'endroit des acteurs;
- Prendre en compte les femmes, les personnes âgées et les jeunes dans les sessions de formation pour renforcer les capacités des producteurs pour accéder aux ressources du projet ;
- Soutenir équitablement les différents groupes dans l'aménagement et la mise en valeur des périmètres ;
- Prendre en compte les groupes vulnérables et marginalisés dans la sélection et la mise en œuvre des sous-projets ;

- Prendre en compte le genre dans l'établissement des critères de sélection des bénéficiaires ;
- Veiller à la participation effective et efficiente des femmes et des jeunes aux différents ateliers de renforcement des capacités ;

b) Phase de construction

- Prendre en compte l'écoulement naturel de l'eau dans la conception des ouvrages.
- Respecter les normes de construction des ouvrages hydrauliques d'irrigation,
- Promouvoir l'emploi de la main d'œuvre locale dans les travaux de construction des ouvrages;
- Sensibiliser les travailleurs sur les risques d'accident du travail ;
- Fournir des équipements de protection individuelle adaptés et veiller à leur port effectif ;
- Sensibiliser les producteurs sur les inconvénients liés à l'emploi des enfants dans des tâches pénibles et à risque, notamment sur leur état de santé et sur leur développement ;
- Faire connaître aux producteurs les dispositions du code de travail à travers un programme d'Information, d'Éducation et de Communication (IEC) ;
- Dimensionner un canal pour assurer l'écoulement normal et régulier de l'eau vers l'aval des périmètres.

c) Phase d'exploitation

- Faire des vérifications périodiques de l'état des ouvrages ;
- Mettre en place des comités villageoise de surveillance des installations et établir des liens entre ces derniers et les structures étatiques d'intervention en cas de sinistres ;
- Etablir un système d'alerte aux populations sur les menaces éventuelles ;
- Etablir un plan d'intervention d'urgence ;
- Renforcer les capacités d'intervention des services de Protection civile de Gabù et de Bafatà ;

- Organiser périodiquement des campagnes d'information, d'éducation et de communication (IEC) sur les dispositions nationales et les principes E&S du FA ;
- Conduire périodiquement des missions de suivi environnemental et social ;
- Promouvoir le développement de pratiques de gestion durable des terres et des sols;
- Eviter l'emploi des enfants;
- S'assurer de la conformité de la mise œuvre des activités avec le cadre juridique du travail ;
- Sensibiliser les travailleurs sur les risques d'accident du travail ;
- Fournir des équipements de protection individuelle adaptés et veiller à leur port effectif ;
- Désigner au sein du groupement un ou deux responsable hygiène-santé-environnement ;
- Renforcer la capacité des producteurs à l'utilisation de pesticides ;
- Sensibiliser les producteurs sur les inconvénients liés à l'emploi des enfants dans des tâches pénibles et à risque, notamment sur leur état de santé et sur leur développement ;
- Faire connaître aux producteurs les dispositions code de travail à travers un programme d'Information, d'Éducation et de Communication (IEC) ;
- Inciter à la participation effective et efficiente des femmes, des jeunes et personnes âgées dans les activités génératrices de revenus ;
- Assurer équitablement l'appui à l'acquisition des intrants agricoles de qualité ;
- Promouvoir le système de l'agroforesterie et de la plantation d'arbres avec une valeur nutritionnelle ou médicinale ;
- Apporter aux producteurs un appui conseil dans l'application des engrais chimiques ;
- Inciter à l'usage des amendements organiques ;
- Encourager la rotation de cultures sur la parcelle ;
- Renforcer la capacité des producteurs pour un usage rationnel des intrants (engrais et pesticides) ;
- Veiller à la bonne réalisation des activités de reboisement ;

- Renforcer la capacité des producteurs de gérer les pesticides conformément aux pesticides à l'aide de normes ;
- Instaurer un système de collecte des emballages de pesticides vides et des pesticides obsolètes ;
- Sensibiliser les producteurs sur les mesures d'hygiène pendant et après les opérations ;
- Informer et sensibiliser les agriculteurs sur les maladies liées à l'eau ;
- Assurer le bon fonctionnement du canal d'écoulement d'eau vers l'aval des périmètres.

d) Phase de fin du projet

- Veiller à la rétrocession des infrastructures aux communautés pour assurer la maintenance continue des forages et leur utilisation à des fins de fourniture d'eau de boissons pour les populations locales et le bétail ;
- Collecter et faire détruire les pesticides obsolètes et les emballages contaminés dans les conditions prescrites par la réglementation nationale.

0.9. Le Plan cadre de gestion environnementale et sociale

Le Plan cadre de gestion environnementale et sociale a été préparé pour servir de guide à la préparation du Plan de gestion environnementale et sociale. Le PCGES comprend : les impacts identifiés en rapport avec les principes du Fonds d'Adaptation, les mesures d'atténuation et de bonification, la période de mise en œuvre de chacune des mesures, les entités responsables de la mise en œuvre, du suivi et d'appui techniques et le budget pour assurer une gestion efficace des impacts sur l'environnement. Pour être effectif, le PCGES est pleinement intégré à l'effort de gestion globale du projet à tous les niveaux. Il doit servir de base pour la réalisation des études environnementales des sous-projets.

Lorsque les sites seront définitivement retenus, chaque site fera l'objet de préparation d'une étude d'impact environnemental et social sur la base des 15 principes du Fonds d'Adaptation. Les résultats d'évaluation des impacts et risques des sous-projets seront utilisés pour mettre à jour le PCGES du CGES. Le PCGES mis à jour avec les résultats des EIES des sous-projets deviendra le Plan de gestion

environnementale et sociale (PGES) du projet. Ce PGES sera applicable à tous les sous-projets suivants les réalités de chaque site.

0.10. La conduite des Etudes d'impact environnemental et social des sous-projets et la formulation du Plan de gestion environnementale et social définitif du projet

Le CGES contient une procédure permettant de conduire la préparation des Etudes d'impact environnemental et social des sous-projets et la formulation du Plan de gestion environnementale et social définitif du projet.

Les études qui seront conduites dans le cadre de cette procédure seront guidées par les principes environnementaux et sociaux du Fonds d'Adaptation. La démarche environnementale proposée, prend en compte la gestion environnementale existante dans la procédure administrative d'évaluation des impacts environnementaux et sociaux en Guinée Bissau dans le cadre du processus d'étude d'impact environnemental et social.

0.11. Diffusion de l'information au public

La communication des rapports relatifs au processus d'évaluation environnementale aux parties prenantes et autres parties concernées par le projet devra respecter les mêmes procédures que celles actuellement appliquées à la divulgation des rapports de conception. Conformément à la législation Bissau-guinéenne et à la Politique de la BOAD en matière de diffusion des documents, les rapports des différentes études environnementales et sociales seront mis à la disposition des parties prenantes et autres parties concernées, sous réserve de l'approbation de la Guinée Bissau. Ainsi, pour se conformer aux dispositions réglementaires, le CGES sera mis à la disposition des personnes bénéficiaires et des acteurs institutionnels concernés.

0.12. Gestion des griefs dans le cadre du projet

Le projet proposé utilisera le mécanisme actuel de règlement des griefs de la BOAD pour permettre aux personnes touchées de soulever des inquiétudes selon lesquelles le projet proposé ne respecte pas ses politiques ou engagements sociaux et environnementaux.

La BOAD a mis en place un mécanisme de règlement des griefs par le biais de et sa politique de règlement des griefs et son manuel de procédures qui est un mécanisme indépendant par lequel les personnes qui ont subi un préjudice résultant d'un projet financé ou mis en œuvre par la BOAD peuvent déposer une plainte auprès de la Banque. Le mécanisme de règlement des griefs, qui est mis à la disposition des parties prenantes, fait partie de la durabilité environnementale, sociale et économique pour traiter les cas de conformité et de règlement des griefs découlant des projets mis en œuvre par la BOAD. Ce manuel définit le mécanisme de règlement des plaintes dans la mise en œuvre de tout projet financé ou mis en œuvre par la BOAD. Il vise à établir un dialogue efficace entre les personnes concernées par les projets qu'ils financent et toutes les parties intéressées, pour résoudre le problème ou les problèmes à l'origine d'une demande, sans chercher à attribuer la responsabilité ou la faute à aucune de ces parties.

Au niveau de la BOAD, le mécanisme de règlement des griefs est coordonné et géré par la Division de Conformité et de Réglementation (DCR) avec le soutien de la Mission résidente de la BOAD dans ses États membres. Les communautés touchées et les autres parties prenantes qui seront affectées par le projet peuvent soumettre des plaintes à la BOAD, l'entité d'implémentation de la présente proposition, par courrier, courriel électronique, fax ou téléphone. Au niveau de la zone d'intervention du projet, l'unité de gestion du projet est le point de contact pour toutes les plaintes liées aux projets des parties prenantes. L'unité de gestion du projet devrait répondre rapidement et de façon appropriée à une plainte avec l'appui de la mission résidente de la BOAD et un rapport est fait à la DCR qui est basée au siège social de la BOAD. Lorsque la plainte ne peut être gérée au niveau du projet, le coordonnateur du projet dirigera les plaignants à remplir un formulaire de plainte pour soumission à la DCR de la BOAD. Le coordonnateur du projet devrait exhorter les plaignants à fournir des informations complètes, de sorte que la BOAD puisse évaluer et traiter correctement la plainte.

Il incombera à l'UGP, sous le contrôle de la BOAD, de veiller à ce que toutes les parties prenantes concernées soient suffisamment informées du mécanisme de règlement des griefs. Ce mécanisme sera mis à disposition des Gouvernorats régionaux et des administrateurs des provinces (secteurs). Des copies du manuel du mécanisme de règlement des griefs seront disponibles au niveau des villages. Il sera également posté sur le site Web du projet et le site Web de l'entité d'exécution (BOAD). Les procédures sur la façon de présenter la plainte sont disponibles sur le site Internet de la BOAD (www.boad.org) ou directement à <https://www.boad.org/en/policies-procedures-guidelines/> (sous le point « DOCUMENTS DE CONFORMITÉ ET GRIEVANCE »).

Si la DCR constate qu'une plainte est admissible, le DCR compose une équipe d'experts interne et / ou externe pour enquêter sur le cas et proposer des options

à considérer pour le plaignant. Un rapport de résolution est fait au président de la BOAD et l'accord établi avec le(s) plaignant(s) est diffusé et exécuté par la Banque.

0.13. La surveillance environnementale et sociale du projet

La surveillance environnementale et sociale est de la responsabilité des promoteurs des sous-projets sous la supervision de l'UGP avec le soutien des institutions techniques nationales et locales concernées. Ces différentes institutions sont indiquées dans le plan cadre de gestion environnementale et sociale.

La supervision se fait au niveau de tous les sous-projets conformément au PGES du projet. Un rapport mensuel sera préparé par le PMU sur la gestion du PGES et envoyé à la BOAD.

0.14. Le suivi environnemental et social du projet

Le suivi environnemental du projet sera assuré par l'Autorité Compétente d'Evaluation Environnementale (AAAC). Cette mission se fera en collaboration avec la Direction de l'environnement et du développement durable, de la Direction de la protection des végétaux, de la Direction de l'agriculture et d'autres structures publiques et privées.

Au niveau régional et local, le dispositif de suivi s'appuiera sur les Directions et services régionaux (environnement, agriculture, protection des végétaux, élevage, santé, protection civile, ONG et Associations, etc.), l'Institut National de recherche agricole.

Pour ce qui concerne le cas spécifique de la gestion intégrée des pestes et pesticides, le suivi du Plan de gestion intégrée des pestes et pesticides (PGIPP) incombera en premier lieu à la Direction de la protection des végétaux (DPV) en collaboration avec d'autres structures avec lesquelles la DPV forme un Comité de gestion des pestes et pesticides.

La BOAD, l'entité d'implémentation, évaluera la mise en œuvre des mesures au moyen des rapports périodiques soumis par l'UGP et ses missions de vérification sur le terrain. Le rapport annuel de l'entité d'implémentation comportera une rubrique sur la mise en œuvre du CGES avec une sous-rubrique sur la gestion

intégrée des pestes et pesticides dans le cadre de l'exécution du projet. Outre les évaluations annuelles de la gestion des pestes et des pesticides qui permettront une amélioration continue de la mise en œuvre du PGIPP, une évaluation à mi-parcours sera menée à la fin de la deuxième année de mise en œuvre et une autre à la fin du projet.

INTRODUCTION

INTRODUCTION

L'agriculture Bissau guinéenne fait face à des contraintes climatiques qui se manifestent par des sécheresses, des inondations, etc. compromettant les efforts des agriculteurs en milieu rural. La conséquence principale de ces effets de changements climatiques est l'enregistrement au niveau national de pénuries répétitives d'aliments liée à la faiblesse de la production agricole entraînant une insécurité alimentaire et nutritionnelle sévère, surtout pour les couches sociales les plus vulnérables.

Bien que le pays dispose d'un potentiel en eau de surface non négligeable, cette eau échappe la technique du monde rural qui était appelé à la mobiliser pour des fins agricoles. En outre, les pratiques agricoles et d'élevage sont non seulement très limités mais ne sont pas durables. Il faut rappeler que l'Est de la Guinée Bissau formé par les régions de Gabù et de Bafatà concentre les deux tiers (2/3) des têtes de bétail du pays. C'est pour apporter un soutien au développement d'activités d'adaptation des populations face aux effets néfastes des changements climatiques que le présent projet "Agriculture intelligente face au climat dans l'Est de la Guinée Bissau" a été identifié par le Cabinet Global Lead et le Secrétariat d'Etat chargé de l'environnement de la Guinée Bissau. Un Project concept note (PCN) a été préparé par le Cabinet Global Lead et soumis au Fonds d'Adaptation par la Banque Ouest Africaine de Développement (BOAD), une Entité régionale d'implémentation des projets du Fonds d'Adaptation. Le PCN a été endossé par le Conseil d'Administration du Fonds d'Adaptation par Décision B.27/9 au cours de sa 27^e réunion les 17 et 18 mars 2016 à Bonn en Allemagne. Le coût total du projet endossé est de 9 979 000 USD à financer entièrement par le Fonds d'Adaptation.

Le projet traite les principales questions de vulnérabilités dans l'agriculture la gestion rationnelle des ressources en eau afin de contribuer la résilience des

populations pauvres avec un accent particulier sur les groupes extrêmement vulnérables notamment les femmes, les personnes âgées et les enfants. Spécifiquement, le projet vise à :

- Développer les capacités techniques et institutionnelles du gouvernement et de la société civile (secteur privé, les communautés locales, les ONG) pour faire face à l'augmentation du risque climatique dans la planification de l'adaptation au changement climatique;
- Améliorer la résilience des systèmes de production agricoles existantes et contribuer à la diversification de la production, y compris la mise en œuvre d'un système de contrôle et de gestion de l'eau et des ressources forestières;
- Promouvoir la diffusion des connaissances, des leçons apprises sur l'agriculture intelligente au climat et de la planification de l'adaptation à d'autres régions de la Guinée Bissau, à d'autres pays d'Afrique de l'Ouest et aux négociations des conférences des parties à la CCNUCC et aux forums internationaux sur les changements climatiques.

Le Projet répond aux priorités des mesures d'adaptation identifiées par le PANA de la Guinée Bissau. En effet, le PANA a identifié six (6) mesures d'adaptation dans le secteur agricole. Il s'agit de : (i) la construction de micro-barrages et de petits digues pour la rétention d'eau; (ii) la promotion de systèmes d'irrigation à faible coût; (iii) la diversification de la production ; (iv) l'augmentation des travaux hydrauliques; (v) la diffusion ou l'extension de semences à cycle court; et (vi) une plus grande diffusion des variétés moins exigeantes à l'eau et résistantes à des sécheresses prolongées.

Ce projet est en adéquation avec les politiques et stratégies de développement agricole et de lutte contre la pauvreté et l'insécurité alimentaire. Il s'agit notamment de : (i) la Déclaration du Développement Agricole qui a pour objectifs de garantir la sécurité alimentaire et la

diversification de la production; (ii) le DSRP qui encourage le développement du secteur agricole pour lutter contre la pauvreté.

Cependant, les actions du projet telles que la mise en place d'infrastructures de mobilisation de l'eau pour le développement du maraichage et de l'élevage, l'appui à la protection et à la création des forêts communautaires, etc. ne seront pas réaliser sans incidences sur l'environnement biophysique et humain. Au regard de la nature de ces impacts négatifs prévisibles, directs ou indirects sur l'environnement biophysique et humain, le projet est soumis à étude d'impact environnemental et social. Etant donné que les sites ne sont pas encore identifiés, un Cadre de gestion environnementale et sociale est donc préparé.

L'objectif du CGES est de mettre à la disposition des structures chargées de sa mise en œuvre, un processus de sélection environnementale et sociale qui leur permettra d'identifier, d'évaluer et d'atténuer les impacts environnementaux et sociaux potentiels des activités du projet dès le stade de planification. À ce titre, il servira de guide à l'élaboration d'Études d'Impact Environnemental et Social (ÉIES) spécifiques des investissements, activités ou composantes dont les sites et les caractéristiques environnementales et sociales restent encore inconnus.

Le document est structuré comme suit :

- une introduction qui présente le contexte du projet;
- une description du projet qui décrit le projet en mettant en évidence les éléments justificatifs, les objectifs et résultats escomptés ainsi que les composantes du projet ;
- une méthodologie ayant servie à la collecte des informations et à la préparation du document
- une description du milieu biophysique et humain des zones d'intervention du projet;
- une analyse du cadre juridique international et national susceptible d'être applicable au projet;

- une description de la procédure environnementale du projet ainsi que les outils de préparation et approbation des activités à financer;
- une évaluation des impacts associés au projet, afin de déterminer les impacts environnementaux et sociaux potentiels du projet ;
- une description et proposition des mesures préventives, de contrôle, d'atténuation et/ou de compensation ;
- un cadre de plan de surveillance et de suivi de l'environnement qui intègre les mécanismes institutionnels de mise en œuvre du CGES, incluant les coûts du PCGES ;
- une dernière partie sur la Consultation publique
- une conclusion générale ;
- les annexes.

Il est important de mentionner que le présent CGES est accompagné, en document séparé, d'un Plan de Gestion de Pestes et des Pesticides pour permettre d'atténuer de façon appropriée les impacts environnementaux et sociaux négatifs potentiels relatifs à l'emploi des intrants agricoles (produits phytosanitaires et engrais chimiques, etc.). Par ailleurs, dans le souci de maintenir les populations dans leur environnement actuel tout en renforçant leur capacité d'adaptation aux changements climatiques, le projet a mis un accent particulier sur la promotion de l'agriculture durable à travers la mobilisation de l'eau pour le développement de l'irrigation et de l'élevage semi-intensif.

CHAPITRE I : DESCRIPTION DU PROJET

1.1. Contexte et justification du projet

La République de Guinée Bissau est un pays côtiers d'Afrique de l'Ouest avec une superficie de 36 125 km² et une population estimée à 1,73 millions d'habitants. Situé à l'est de l'Océan Atlantique, elle borde le Sénégal au Nord et la République de Guinée à l'Est et au Sud, le pays est organisé en 8 régions administratives. La densité de la population est de 47,8 habitants par km² avec un taux annuel de croissance de la population est de 1,9%. Malgré la forte urbanisation au cours de ces dernières années, encore environ 58% de la population vit dans les zones rurales. Bissau, la capitale, abrite environ un quart de la population totale.

Les principales activités socio-économiques du pays concernent l'agriculture, la pêche, la sylviculture, l'élevage et l'extraction minière. L'agriculture comme secteur économique primaire de la Guinée Bissau est en grande partie basée sur l'agriculture de subsistance, en mettant l'accent prédominant sur le riz, la noix de cajou. Elle emploie 82% de la population active et génère 45% du PIB.

Cependant, cette agriculture est confronté à d'énormes contraintes d'ordre édaphique (l'érosion des sols, en particulier dans la culture itinérante), climatique et humaine (le surpâturage, la déforestation, etc.) surtout dans les régions de l'est de la Guinée Bissau. En effet, l'Est de la Guinée Bissau est une région des zones arides qui est extrêmement vulnérable aux changements climatiques et à la variabilité. Cette zone connaît des événements climatiques extrêmes (sécheresses, inondations, etc.). Les mécanismes d'adaptation développés par les agriculteurs familiaux dans certaines régions comme les régions de Gabù et Bafatà sont entre autres : le nomadisme temporaire, la réduction de la consommation alimentaire, la vente des actifs des ménages qui sont d'ailleurs rares, la migration vers les villes, etc. Ces mesures ne sont pas durables et plongent davantage les populations dans une situation de pauvreté, d'insécurité alimentaire, etc.

D'après, les résultats d'une récente enquête conduite sur la pauvreté dans le pays dans le cadre du suivi des indicateurs de réduction de la pauvreté (ILAP2

2010)¹, le taux de pauvreté globale de la population est à 69,3% contre 64,7% en 2002 (ILAP1). Le nombre de pauvres dans le pays est passé donc de 764 672 en 2002 à 1 014 277 personnes en 2010 soit une hausse de 24% le nombre de pauvre. Quant à l'extrême pauvreté, le taux est passé de 20,8% en 2002 à 33,0% en 2010 traduisant une nette détérioration de la situation dans le pays avec une dégradation des conditions de vie des ménages les plus pauvres et l'arrivée de « nouveaux pauvres ».

Le phénomène est plus accentué en milieu rural.

C'est dans ce contexte que s'inscrit le projet dont l'objectif principal est de renforcer la résilience des populations à travers la promotion d'une agriculture intelligente face au climat pour soutenir la sécurité alimentaire en Guinée Bissau. The project will address key vulnerabilities in agriculture and water resources management, and thus contribute to immediate and longer-term development and resilience needs of extremely vulnerable farmers, with a particular focus on extremely vulnerable groups: women, elderly and children. As such, the project is in line with the recommendations of the UNFCCC Nairobi Work Programme (UNFCCC, 2010) and the best available scientific evidence on climate change impacts, vulnerability and adaptation in agriculture, water resources as well as food security (Niang et al., 2014; Porter et al., 2014).

Ainsi, la mise en œuvre du projet permettra d'intensifier la production agricole sous-irrigation dans les régions retenues (Gabù et Bafatà), en contribuant à résoudre le problème d'insécurité alimentaire. La mobilisation de l'eau permettra aussi d'alimenter le bétail. Il constitue ainsi un facteur incitatif de développement des exploitations agricoles à travers la promotion de l'irrigation.

Ces objectifs s'intègrent bien dans la vision de développement 2035 de la guinée Bissau.

¹ Inquérito Ligeiro para Avaliação da Pobreza (ILAP)

1.2. Objectifs du projet

Le projet, tel que conçu, traitera des principales questions de vulnérabilités dans l'agriculture et de la gestion rationnelle des ressources en eau afin de contribuer au développement et à la résilience des besoins immédiats et à long terme des agriculteurs extrêmement vulnérables, avec un accent particulier sur les groupes extrêmement vulnérables notamment les femmes, les personnes âgées et les enfants.

En lien avec la vulnérabilité du pays et les besoins d'adaptation identifiés, trois objectifs spécifiques sont poursuivis dans le cadre de ce projet:

Spécifiquement, le projet vise à :

1. Développer les capacités techniques et institutionnelles du gouvernement et de la société civile (secteur privé, communautés locales, ONG, etc.) pour faire face à l'augmentation du risque climatique dans la planification de l'adaptation au changement climatique;
2. Améliorer la résilience des systèmes de production agricoles existantes et contribuer à la diversification de la production, y compris la mise en œuvre d'un système de contrôle et de gestion de l'eau pour réduire au minimum les risques de sécheresses intenses et les inondations;
3. Promouvoir la diffusion des connaissances, des leçons apprises sur l'agriculture intelligente au climat et de la planification de l'adaptation à d'autres régions de la Guinée Bissau, à d'autres pays d'Afrique de l'Ouest et aux négociations des conférences des parties à la CCNUCC et aux forums internationaux sur les changements climatiques.

Ces objectifs s'inscrivent en droite ligne de ceux énoncés par le Fonds d'Adaptation visant à "Réduire la vulnérabilité et accroître la capacité d'adaptation pour répondre aux impacts du changement climatique, y compris la variabilité au niveau local et national".

Le projet s'intègre également dans les documents de politique, stratégie et

plan relatifs au développement de l'agriculture en Guinée Bissau, à la réduction de la pauvreté, au renforcement de la sécurité alimentaire et les capacités des populations à mieux s'adapter au changement climatique. Le projet s'intègre également dans la vision de développement 2035 de la Guinée Bissau.

La mise en œuvre du projet permettra d'intensifier la production agricole sous-irrigation avec une maîtrise partielle de l'eau dans les régions retenues (Gabù et Bafatà), d'améliorer les conditions d'alimentation en eau potable dans les villages bénéficiaires, de contribuer à la gestion des ressources naturelles notamment les forêts à travers le renforcement des capacités pour la lutte contre les feux de brousse, le contrôle et la surveillance des forêts, le reboisement des alentours des périmètres avec des plantes fruitiers utilitaires, etc.

1.3. Composantes du projet

Pour atteindre les objectifs ci-dessus, le projet a été structuré en trois composantes à savoir :

- Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification
- Accroissement de la résilience des systèmes productifs agricoles existants, y compris les mesures de contrôle et de gestion de l'eau
- Gestion de la connaissance et des leçons apprises sur l'agriculture intelligente

Au-delà de ces trois composantes de base, le comporte une composante relative à la gestion et coordination du projet.

Pour chacune desdites composantes, les activités ont été planifiées afin d'atteindre les objectifs poursuivis par le projet.

Composante 1. Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification

Le projet propose un renforcement des capacités techniques et institutionnelles pour la planification des mesures d'adaptation au

changement climatique. Cela comprendra le développement participatif des mesures d'adaptation agricole et de gestion de l'eau sur les sites et l'élaboration de plans d'intervention d'urgence (protection contre les inondations par exemple) pour la gestion des risques climatiques. Un autre accent sera mis sur le renforcement des interactions entre les acteurs concernés par l'adaptation au changement climatique: le gouvernement, les services météorologiques, le secteur de l'agriculture, des instituts de recherche, le gouvernement régional et national, ainsi que les médias et les communautés locales et autochtones.

Dans le but d'assurer une intégration parfaite des questions environnementales et sociales et le genre, le projet propose des actions de renforcement des capacités des acteurs impliqués dans la mise en œuvre du projet.

Il sera mis en place des brigades de feu qui bénéficieront des formations de renforcement de capacités dans la surveillance et la lutte contre les feux de brousse dans l'intérêt de préserver les formations forestières restantes et les plantations qui constituent des sources de revenus substantiels pour les populations.

Les résultats attendus et les activités planifiés sont:

Résultat 1.1 : Une évaluation de la vulnérabilité socio-climatique de l'Est de la Guinée-Bissau est conduite afin de sortir les réels besoins d'adaptation. Les activités envisagées sont :

- Évaluation des besoins en matière de capacité technique pour les ministères et les agents de terrain
- Plan d'intervention détaillé pour les actions pilotes d'agriculture intelligente en faveur du climat en Guinée-Bissau-Est

Résultat 1.2 : Les groupes d'agriculteurs, les professionnels du développement et les experts gouvernementaux ont intégré des connaissances sur l'agriculture intelligente au climat, en pratique (sur place) et sur la planification de l'adaptation

- Formation technique pour les groupes cibles identifiés sur les pratiques agricoles
- Renforcement des capacités organisationnelles des agriculteurs
- Développement participatif d'actions d'adaptation agricole et de gestion de l'eau sur place
- Assistance technique et vulgarisation rurale pour les sous-projets
- Renforcement des capacités en matière de gestion des S & S et d'intégration de la dimension de genre

- Renforcement des capacités des brigades de pompiers pour prévenir les incendies de forêt
- Sensibilisation des populations locales à la gestion de la protection des forêts
- Renforcement des capacités des acteurs sur la gestion intégrée des pestes et pesticides
- Renforcement des capacités groupes de producteurs sur les bonnes pratiques et alternatives de gestion des pestes et pesticides ;
- Renforcement des capacités en matière de gestion des plans d'urgence.

Composante 2. Améliorer la résilience des systèmes de production agricole existants, y compris les mesures de contrôle et de gestion de l'eau

Cette composante vise à mettre en place les infrastructures de rétention des eaux pour assurer l'irrigation des cultures. Elle vise à accroître les productions et rendre disponible les produits alimentaires pour la consommation propre et éventuellement pour la commercialisation. Il s'agira de construire des seuils d'irrigation sur les sites identifiés. Des actions d'amélioration de la qualité du sol et de la protection des zones de mise en valeur contre l'ensablement seront entreprises.

Le projet apportera un appui technique dans le développement et la mise en valeur des sites à travers les services techniques du Ministère de l'agriculture et les autres institutions impliquées dans le projet.

Le projet réalisera au profit de la population des forages à motricité humaine dans les villages retenus pour améliorer l'alimentation en eau potable. A ces forages seront associés des abreuvoirs pour l'alimentation en eau du bétail.

Les résultats et activités spécifiques sont :

Résultat 2.1: Les activités agricoles sont intelligentes sur le plan du climat et contribuent à une augmentation durable de la productivité et renforcent la sécurité alimentaire nationale. Les activités sont :

- Construction de systèmes d'irrigation (digues, diguettes, bassin de rétention d'eau pluvial, forage, etc.) pour maintenir la production agricole en période de sécheresse
- Protection des sites contre l'érosion et l'ensablement à travers la mise en place des digues antiérosives et le reboisement des alentours des sites avec les arbres fruitiers adaptés
- Réhabilitation de la productivité des sols avant la mise en valeur des périmètres, y compris les investissements à petite échelle dans les

- machines et les outils de production
- Réalisation des forages d'eau à action humaine dans les villages bénéficiaires pour améliorer l'approvisionnement en eau domestique et pour le bétail ;
 - Développement de champ de pâturage pour le bétail.

Composante 3. La gestion des connaissances des enseignements tirés de l'agriculture intelligente face au climat et à la planification de l'adaptation

Afin de garantir la visibilité des résultats du projet une stratégie de gestion des connaissances sera développée. Le produit de diffusion de base du projet sera un manuel de bonnes pratiques dans l'agriculture résiliente au changement climatique. Différentes versions du manuel seront produits, les deux sujets thématiques pertinents, techniques et non techniques, en portugais, en français et en anglais. Des informations sommaire sur feuilles / brochures / calendriers seront produites. Les manuels seront diffusés sur le site Web du projet et une suite d'ateliers au niveau national et provincial. En outre la diffusion aura lieu dans toute la région Afrique de l'Ouest grâce à des ateliers et à la diffusion de copies papier. L'équipe du projet sera en outre en interaction avec des médias nationaux (presse, internet, radio, etc.) pour rendre le public conscient des risques climatiques et des besoins d'adaptation. Publications scientifiques en ce qui concerne l'impact sur l'évaluation des composants n ° 2 est également prévu.

Les résultats et activités sont:

Résultat 3.1: Des pratiques et une gestion agricoles intelligentes et respectueuses du climat sont adoptées dans des régions comparables du pays et diffusées dans d'autres pays d'Afrique de l'Ouest, contribuant ainsi à la résilience et aux besoins de développement dans ces régions. Les activités sont :

- Développement d'une stratégie de gestion des connaissances
- Création et animation d'un site web du projet pour la diffusion des informations
- Elaboration des manuels sur les meilleures pratiques agricoles et les mesures en faveur d'une agriculture respectueuse du climat
- Diffusion des résultats dans d'autres régions de la Guinée-Bissau et en Afrique de l'Ouest.

1.4. Classification environnementale et sociale du projet

Les principales activités du projet, sont entre autres :

- le renforcement des capacités des acteurs sur les changements climatiques et leurs effets sur la sécurité alimentaire ;
- la sensibilisation des communautés à la base sur les menaces liées aux changements climatiques et les mesures d'adaptation et de résilience relatives au secteur agricole ;
- la formation des producteurs aux pratiques agricoles susceptibles de préserver durablement le sol et les ressources en eau ;
- les travaux d'ouvrages d'aménagement :
 - transport des équipements ;
 - installation et repli de chantier ;
 - implantation ;
 - préparation et décapage de terrain ;
 - abatage des arbres ;
 - fouille pour ouvrage ;
 - remblai latéritique ;
 - enrochement de protection aval,
- Mise en valeur des périmètres :
 - Défrichage/Désherbage ;
 - Labour ;
 - Semis ;
 - Entretien ;
 - application des fertilisants (fumure organique ou engrais chimiques);
 - utilisation des pesticides ;
 - récolte ;
 - etc.

Ces activités auront des impacts sur l'environnement biophysique et humain.

Le Fonds d'Adaptation présente un ensemble de principes par lesquels il édicte les normes de sauvegarde environnementale et sociale applicables aux projets qu'il finance.

Malgré les effets positifs qui peuvent améliorer les résultats du projet, les activités présentent des impacts environnementaux et sociaux négatifs. De nombreux principes environnementaux et sociaux du Fonds pour l'Adaptation sont déclenchés par le projet en termes d'impacts et risques environnementaux et sociaux. Suite aux enquêtes de terrains et aux recherches documentaires, il est apparu qu'il n'existe pas de peuples indigènes en Guinée Bissau. Vu que la demande des bénéficiaires est très importante par rapport aux ressources

financières disponibles, il a été retenu avec les bénéficiaires et les structures de l'Etat que tout site qui pourrait comporter un déplacement involontaire quelconque ne sera pas retenu dans le cadre du présent projet. Les principes applicables dans le cadre du projet, en considérant les différentes activités ci-dessus, sont présentés dans le tableau ci-dessous.

Tableau 1: Détermination des principes du Fonds d'Adaptation déclenchés par le projet

Checklist of environmental and social principles	No further assessment required for compliance	Potential impacts and risks – further assessment and Management required for compliance
Compliance with the Law		X
Access and Equity		X
Marginalized and Vulnerable Groups		X
Human Rights		X
Gender Equity and Women's Empowerment		X
Core Labour Rights		X
Indigenous Peoples	X	
Involuntary Resettlement	X	
Protection of Natural Habitats		X
Conservation of Biological Diversity		X
Climate Change		X
Pollution Prevention and Resource Efficiency		X
Public Health		X
Physical and Cultural Heritage		X
Lands and Soil Conservation		X

De l'engrais et des pesticides seront utilisés par les producteurs avec des effets négatifs potentiels sur la santé humaine, la flore et la faune. Le projet n'occasionnera pas de déplacement involontaire quelques soient les aspects considérés. Il n'affectera pas non plus de peuples indigènes. Cependant le patrimoine culturel peut être accidentellement touché, dans un contexte de découvertes fortuites. Dans ce cas, les acteurs du projet prendront des mesures pour changer de site.

Après une analyse du projet par le biais du contrôle environnemental et social, les impacts négatifs potentiels environnementaux et/ou sociaux du projet sont de faible ampleur, réversibles et facilement atténuables. Ainsi, les caractéristiques du projet correspondent à un projet de catégorie B conformément à la politique environnementale et sociale du Fonds

d'Adaptation². Le projet est donc classé en catégorie B.

L'évaluation des impacts environnementaux et sociaux de ce projet est d'examiner les effets positifs et négatifs que le projet pourrait avoir sur l'environnement et les populations et recommander toutes les mesures nécessaires pour prévenir, minimiser, atténuer ou compenser les effets indésirables et améliorer la performance environnementale et sociale dudit projet.

² Selon la politique environnementale et sociale du Fonds d'Adaptation, tous les projets/programmes susceptibles d'avoir d'importantes incidences environnementales ou sociales négatives qui sont par exemple diverses, généralisées et irréversibles doivent être classés en catégorie A. Les projets/programmes avec les impacts négatifs potentiels qui sont moins nocifs que les projets/programmes de catégorie A, parce que par exemple, ils sont moins nombreux, plus petits, moins répandus, réversibles ou facilement atténués devraient être classés en tant que catégorie B.

CHAPITRE II : CADRE POLITIQUE, JURIDIQUE ET INSTITUTIONNEL

2.1. Cadre politique

2.1.1. Secteurs agricole, eau et foncier

❖ La Nouvelle Lettre de politique pour le développement agricole

La Nouvelle Lettre de Politique de Développement Agricole (NLPDA) vise à : (i) améliorer l'efficacité et l'efficience des exploitations familiales et des marchés, (ii) promouvoir l'entrepreneuriat agricole grâce à la stimulation de l'initiative privée et (iii) améliorer l'efficacité des exportations. L'impact de cette nouvelle politique devra se mesurer à travers: i) l'amélioration de la sécurité alimentaire à travers la diversification des productions vivrières et la réduction des importations de riz ; ii) l'amélioration progressive de la balance des paiements.

Pour se faire, la NLPDA a défini trois axes stratégiques pour assurer le développement agricole de la Guinée Bissau. Il s'agit de :

Axe stratégique n°1 : Renforcer la sécurité alimentaire par la diversification et l'accroissement des productions vivrières et animales pour promouvoir la souveraineté alimentaire. Cet axe identifie la diversification des cultures comme une alternative pour assurer la sécurité alimentaire et réduire les importations.

Axe Stratégique n°2 : Accroître les revenus agricoles par les opportunités d'exportations agricoles dans le cadre de la lutte contre la pauvreté. Cet axe encourage, entre autres, les productions horticoles et fruitières avec des produits comme la tomate, le haricot, le melon, le piment, la mangue, le café, etc.

Axe stratégique n° 3 : Développer des mesures transversales d'accompagnement pour garantir l'efficacité des investissements. Cet axe met l'accent sur la gestion des ressources forestières, le foncier rural, la gestion de la fertilité des sols, la gestion des ressources pastorales et l'intégration agriculture- élevage, l'amélioration de la qualité des services publics agricoles, Le financement du secteur rural, l'amélioration de la formation agricole et rurale, etc. Cet axe encourage la mise au point et la diffusion des technologies appropriées à une gestion intégrée de la fertilité des sols qui respecte l'environnement; le développement du marché des intrants agricoles, en particulier des engrais et amendements calciques; et le renforcement des capacités des acteurs impliqués dont l'Association des Producteurs et Importateurs d'Intrants Agricoles (APIDIA) , les OPA et les services chargés du contrôle des engrais et de la législation en la matière.

Le présent projet s'intègre dans les axes de cette Nouvelle lettre de politique de développement agricole.

❖ **Plan national d'investissement agricole (PNIA)**

Le plan national d'investissement agricole (PNIA) de la Guinée Bissau comporte six (06) axes majeurs à savoir :

- i) Amélioration de la gestion de l'eau - irrigation et gestion intégrée des ressources en eau ;
- ii) Développement d'une agriculture durable - gestion intégrée de la fertilité des sols, renforcement du soutien aux producteurs et diffusion de technologies améliorées ;
- iii) Amélioration de la gestion des autres ressources naturelles (gestion durable des ressources forestières et des ressources en eau) ;
- iv) Développement des marchés agricoles et des filières alimentaires, agriculture péri-urbaine, cultures d'exportation, élevage à cycle court, produits alimentaires agroforestiers, pêche et aquaculture) ;
- v) Prévention et gestion des crises alimentaires et autres catastrophes naturelles (systèmes d'alerte précoce) ;
- vi) Appui institutionnel (meilleure capacité de créer des politiques et stratégies rurales et agricoles, appui aux capacités des projets pilotes ruraux et coordination et renforcement des capacités pour le suivi et l'évaluation

Ce plan identifie cinq priorités que sont :

- Priorité 1: Développement de la production vivrière
- Priorité 2: Diversification des exportations et valorisation des produits agricoles
- Priorité 3: Création des conditions pour l'intégration du secteur des pêches dans l'économie
- Priorité 4: Développement de l'élevage à cycle court

Priorité 5: Amélioration des infrastructures rurales et de l'accès aux marchés agricoles

❖ **Plan directeur de l'eau**

Le plan directeur de l'eau englobe : (i) les actions de réhabilitation et d'extension des infrastructures hydrauliques, notant le rôle important joué par la gestion des ressources en eau dans le secteur agricole. (ii) la rationalisation de l'utilisation de l'eau, en coordination et en harmonie avec d'autres

ressources nationales, l'utilisation des terres et l'équilibre des écosystèmes, (iii) l'élaboration du Plan d'utilisation de l'eau par rapport aux bassins hydrographiques nationaux; (iv) promotion de la coopération internationale dans le domaine de la gestion des ressources en eau.

❖ **Code de l'eau**

Il est conçu comme un ensemble de principes et normes encadrant les actions de l'État, et son objectif est de, planifier l'exploitation, la conservation et l'optimisation de la gestion des ressources hydriques.

❖ **Loi sur la terre (Loi sur le foncier)**

La Guinée Bissau a adopté la Loi 4/75 qui nationalise la terre et détermine que : *"Le sol, dans la totalité du territoire national, soit urbain, rustique ou urbanisé est intégré dans le Domaine public de l'État, étant susceptible de réduction à la propriété particulière"*.

Cette Loi vise essentiellement appeler à la propriété, le droit sur la terre, le sol et le sous-sol et impulser un nouveau concept sur le droit d'utilisation de la terre où la non utilisation, dans le sens de la non utilité économique ne constitue pas un élément fondamental pour la perte de ce droit, en utilisant l'expression la terre et de celui qui en profite.

Les grands objectifs de cette loi sont:

- a) Garantir la terre aux communautés locales dans la limite qu'elles puissent lui donner une utilité économique;
- b) Incorporer le régime coutumier de la terre dans le droit positif, ainsi que les institutions qui le représente;
- c) Stimuler l'investissement de la terre par la création d'une valeur de marché pour la terre.

Avec cet abordage, il se prétend analyser les articles présents dans cette Loi qui sont directement liés aux dispositions rurales de la terre et des groupes de communautés locales, et aussi les aspects immédiats.

Dans le chapitre I, article 3^{ème} , alinéa c) de la présente Loi, la Communauté Locale: est définie comme « entité coutumière de base territoriale, qui correspond à l'agrégat formé par des familles et des individus résidants dans une certaine circonscription du territoire national (tabancas ou ensemble de tabancas), pour la poursuite des intérêts historiques, économiques, sociaux et culturels communs incluant les aires de résidences, agricoles et forestiers, les pâturages, les points d'eau, les sites d'importance culturelle et les respectives zones d'expansion».

Dans l'alinéa b) du même chapitre et article, l'usage coutumière est définie comme étant "l'utilisation de la terre en conformité avec les règles, les habitudes et les pratiques traditionnelles et constantes d'une certaine Communauté Locale, qui définissent les pouvoirs et devoirs réciproques et disciplinent leur gestion".

L'alinéa d) définit, la Concession Rurale comme étant « Un contrat administratif, onéreux ou gratuit, par lequel l'État transfère à une entité particulière l'utilisation privative de la terre, à des fins agricoles, d'élevages, agro-pastoraux, agro-industriels, sylvicoles et touristiques, dans ces zones localisées en dehors des limites des secteurs urbains».

En ce qui concerne l'article 5^{ème}, sur la gestion des terres, celle-ci devra observer quelques principes fondamentaux, tels que dans le n° 1, dans son alinéa a) qui définit que la « protection des sols est d'intérêt général et intègre les politiques de protection de l'environnement et du développement durable».

L'alinéa b) définit que « les sols constituent un patrimoine commun et une ressource naturelle non renouvelable d'importance vitale pour l'humanité, présente et future ».

L'alinéa c) définit que « l'utilisation des sols prendra en considération la multiplication de ses fonctions écologiques et sa considération en tant que ressource limitée ».

Dans l'alinéa d) « la protection des sols devra être prise en considération dans la définition des politiques agricoles, sylvicoles, industrielles, de transport, urbanisme et d'aménagement du territoire».

L'alinéa e) préconise que « la politique de protection des sols doit être accompagnée d'un processus d'information et de participation des citoyens ».

Tous ces alinéas du n° 1 de l'article 5^{ème} visent à interdire l'utilisation incontrôlée des terres, ce qui permettra d'établir des critères d'utilisation visant une gestion durable des terres.

2.1.2. Secteur de l'environnement

❖ Politique environnementale et Plan national de gestion environnementale (PNGA)

Le PNGA a été adopté par le gouvernement le 21 février 2004. Il s'agit d'un document cadre de politique réglementaire sur les questions environnementales en Guinée-Bissau. Il aborde les principaux problèmes des autres secteurs du développement, non seulement en termes de préservation, mais également de développement durable. Ainsi, la politique de gestion de l'environnement vise à favoriser un développement socio-économique durable en Guinée-Bissau et à rechercher des solutions axées sur la sécurité alimentaire, l'éradication de la pauvreté, la réduction de la pollution et le contrôle de l'assainissement, la protection des ressources naturelles et la lutte contre la désertification, ainsi que l'atténuation des impacts anthropogènes qui influent sur les changements climatiques.

❖ Le plan national de gestion environnemental

Cet instrument stratégique d'orientation pour la mise en œuvre de la politique Environnementale, propose dans ses objectifs générales, que la politique nationale de gestion environnementale puisse contribuer au

développement socio-économique durable et soutenable du pays et appuyer dans la recherche des solutions afin de garantir la sécurité alimentaire, l'éradication de la pauvreté, le contrôle des pollutions et assainissement.

Dans ses objectifs spécifiques, les aspects suivants sont visés: (i) dans le cadre de la gestion participative, développer et appuyer la mise en place d'une gestion décentralisé et participative des ressources naturelles; (ii) appuyer les différentes associations de base, ainsi d'autres partenaires, pour pouvoir jouer un rôle prépondérant dans la gestion des ressources naturelles.

❖ **La Stratégie Nationale pour les Aires Protégées et la Conservation de la Biodiversité**

Stratégie National pour les Aires Protégées a fixé trois axes stratégiques :

L'axe Stratégique I- Renforcement institutionnel, dont l'objectif s'est de : (i) créer un cadre institutionnel et juridique que le permettra assumer une autorité et une intervention efficaces dans la gestion des terroirs des aires protégées et de la biodiversité ; (ii) Créer des conditions pour le financement durable.

Dans l'axe II- Renforcer la gestion du réseau des Aires Protégées, ayant comme un des objectifs disposer d'instruments juridiques et de systèmes de signalisation et surveillance opérationnelles et efficaces.

Au niveau du dernier axe – Connaissance et valorisation de la biodiversité, qu'a pour un des objectifs (i) l'amélioration des connaissances scientifiques de la biodiversité, des processus naturelles, des services rendus par les écosystèmes et de l'utilisation des ressources renouvelables dans les AP et ses zones périphéries ; et (ii) améliorer la connaissance et les activités de conservation dirigées aux espèces prioritaires.

❖ **Le Plan d'Action National d'Adaptation aux Changements Climatiques**

Le document stratégique pour ce domaine affirme que les impacts des changements climatiques se font déjà sentir dans les différents secteurs économiques du pays, en particulier à cause de la diminution des pluies et à l'augmentation tendancielle de la température.

Il y a des problèmes au niveau des autres secteurs, notamment l'agriculture, où la production de culture alimentaire base du guinéen (le riz), a réduit de façon accentuée, la température de l'air est plus élevée; les périodes sèches sont plus prolongées, en particulier dans les régions de l'intérieur (est du pays); les zones humides ont décru.

Pour faire face aux problèmes provoqués par ce fléau ils ont été élaborés un certain nombre de projets d'adaptation à ces phénomènes de changements climatiques dans les différents secteurs ou sous-secteurs (eau, agriculture, forêts, pêches, l'élevage).

❖ **Le Programme d'Action National de Lutte contre la Désertification (PAN/LCD)**

De façon très claire, ce Plan stratégique se fonde sur la gestion multifonctionnelle du patrimoine ou des ressources, fondée sur une connaissance parfaite issue de la pratique et d'une recherche de qualité sur (i) la fonction écologique (gestion centrée sur la biodiversité); (ii) la fonction économique (de production); (iii) la fonction sociale (priorité à la chasse, forêts sacrées etc.).

2.2. Cadre juridique

2.2.1. Cadre juridique international

Plusieurs textes internationaux signés ou ratifiés par la Guinée Bissau traitant spécifiquement de la protection de l'environnement vont s'appliquer dans le cadre de la mise en œuvre du projet. Il s'agit des textes internationaux ci-après :

Tableau 2 : Conventions internationales applicables aux activités du projet.

Intitulé du texte	Dates de signature/entrée en vigueur	Date de signature et ratification par la Guinée Bissau	Domaine	Textes
Convention sur la Diversité Biologique	Signée le 11 juin 1992 à Rio de Janeiro (Brésil), et entrée en vigueur le 24 mars 1994	27 octobre 1995	Biodiversité	« Chaque partie contractante adopte des procédures permettant d'exiger l'évaluation des impacts sur l'environnement des projets qu'elle a proposés et qui sont susceptibles de nuire sensiblement à la diversité biologique en vue d'éviter et de réduire au minimum de tels effets et s'il y a lieu, permet au public de participer à ces procédures » article 141a-b. Ainsi, le PROJET doit prendre toutes les dispositions pour éviter la destruction des éléments de la biodiversité, surtout avec les traitements phytosanitaires.
Convention Cadre des Nations Unies sur les Changements Climatiques	Signée le 11 juin 1992 à Rio de Janeiro (Brésil), et entrée en vigueur le 24 mars 1994	27 octobre 1995	Changement climatique	Cette convention précise à l'article 4, alinéa f, « que les parties signataires tiennent compte, dans la mesure du possible, des considérations liées aux changements climatiques dans leurs politiques et actions sociales, économiques et environnementales, et utilisent des méthodes appropriées, par exemple des études d'impacts, formulées et définies sur le plan national pour réduire au minimum les effets préjudiciables à l'économie, à la santé publique et à la qualité de l'environnement des projets ou mesures qu'elles entreprennent en vue d'atténuer les changements climatiques ou de s'y adapter ».

Convention de Stockholm sur la protection de la santé humaine et de l'environnement contre les Polluants Organiques Persistants (POPs)	Adoptée à Stockholm le 22 mai 2001, entrée en vigueur le 17 mai 2004		Santé humaine et protection de l'environnement	Elle a pour objectifs de protéger la santé humaine et l'environnement contre les Pollutions Organiques Persistants. Ainsi, le PROJET doit veiller à l'utilisation des produits homologués lors des traitements phytosanitaires.
Convention de Rotterdam	-		Santé humaine et protection de l'environnement	Elle offre aux pays un outil de choix pour réduire les risques liés à l'utilisation des pesticides.
Politique Commune d'Amélioration de l'Environnement (PCAÉ) de l'UEMOA	Adoptée le 17 janvier 2008		Protection de l'environnement	L'acte additionnel n°001/CCEG/UEMOA portant adoption de la PCAÉ, dispose à son article 6 énonce que la PCAÉ respecte entre autres, les principes directeurs suivants : la précaution, la prévention, l'information et la notification préalable et la réparation ou le pollueur-payeur ». Quant à l'article 9, il précise que l'Union et les états membres s'engagent à réaliser systématiquement des ÉIES préalables à toute politique, tout investissement ou toute opération susceptible d'avoir des impacts sur l'environnement. Ainsi, la réalisation de cette présente évaluation environnementale se justifie.

2.2.2. Cadre juridique national

Le dispositif juridique de la Guinée Bissau en matière d'environnement concerne la loi de base n°1/2011 du 2 mars sur l'environnement et la loi n° 10/2010 du 24 septembre sur l'évaluation environnementale. Quant à la gestion de l'environnement et la conservation de la diversité biologique bénéficie de plusieurs textes législatifs et réglementaires, il s'agit de : le décret-loi n°5/2011 cadre sur les aires protégées ; le décret 14/2011 du 22 février sur les forêts. La loi n°2/98 du 28 avril sur le foncier est également un texte pertinent dans le cadre de la mise en œuvre de ce projet.

Cette section traite des textes législatifs et réglementaires de protection de l'environnement en Guinée Bissau qui seront directement concernés par la réalisation du projet. Ainsi, le tableau ci-après présente les obligations et dispositions législatives et réglementaires de protection de l'environnement en Guinée Bissau, qui concernés par les interventions du projet.

➤ La loi de base sur l'environnement

La Loi organique sur l'environnement est un instrument législatif qui dispose comme principe général en son article 2 que : « Toute personne a droit à un environnement humain écologiquement équilibré et a le devoir de le défendre, et il est de la responsabilité de l'Etat, par le biais d'organismes qualifiés et en faisant appel à l'initiative populaire et communautaire, d'œuvrer pour l'amélioration de la qualité de la vie, soit au niveau individuel, soit au niveau collectif ».

La politique de l'environnement cherche à optimiser et à garantir la continuité dans l'utilisation des ressources naturelles, qualitativement et quantitativement, comme principe fondamental pour un développement durable.

Ces principes sont établis à partir d'un éventail de mesures (article 4) dont l'objectif est de fournir un cadre qui favorise la santé et le bien-être des personnes, le développement social et culturel des communautés, ainsi que l'amélioration de la qualité de vie.

Au plan des normes, la loi ne dispose pas les limites réglementaires environnementales, comme par exemple, la qualité du sol, la qualité de l'eau, et qui pourraient être applicables au projet.

➤ La loi sur l'évaluation environnementale

La loi sur l'évaluation environnementale en son article 6 « intitulé instrument de

classification des projets » définit en sa section 1 les outils d'évaluation environnementale et prévoit comme outils d'évaluation environnementale dans le cadre de la réalisation d'un projet, les outils suivants : l'étude d'impact sur l'environnement, évaluation environnementale stratégique, l'analyse des risques et études de danger ; la consultation publique, l'audit environnemental, l'information sur l'environnement, l'évaluation économique de l'environnement, le suivi environnemental, le plan de gestion environnemental et social, le cadre de gestion environnemental et social, le plan d'action de réinstallation et le plan d'occupation interne.

L'article 7 de la même loi classe les projets par catégorie : Projets de la catégorie A ; Projets de la catégorie B ; Projets de la catégorie C. La catégorie A concernent les projets à risques élevés et pouvant avoir de multiples incidences négatives assez significatives sur l'environnement et la santé sociale, parfois avec des effets à grande échelle. La catégorie B regroupent des projets susceptibles d'avoir, sur les populations et l'environnement, des incidences négatives moins graves que celles de la catégorie précédente et ce sont généralement des incidences de nature locale et de courte durée, avec des possibilités de prendre des mesures en vue de les atténuer. Les projets dont les incidences négatives sur l'environnement et sur la santé sont insignifiantes ou inexistantes sont classés dans la catégorie C. Après un examen préalable, aucune autre mesure relative à l'évaluation de l'environnement ne s'avère nécessaire pour les projets relevant de cette catégorie. Les annexes I, II et III de cette réglementation détermine la liste nominative des projets, politiques, plan et programmes des secteurs d'activités concernés par l'évaluation environnementale mais c'est la procédure administrative des Évaluations Environnementales qui spécifie le processus qui aboutit à la classification des projets selon les catégories A, B, C.

➤ **Décret-loi n°5/2011 portant sur la forêt**

Cette loi définit en son article 2 alinéa 3 qu'une forêt est une formation naturelle ou un système artificielle de formations composées des mangroves, palmeraies, forêt galeries et les autres types de formations végétales comme les forêts subhumides, denses, semi-décidues, moyennement dense, subtropicale en régénérescence et les savanes arborées et herbacées. En son article 10 alinéa, cette loi stipule que la classification sous le régime de forêt doit être motivée par la nécessité de conservation des ressources forestières et ceci toute la durée que l'Etat juge nécessaire pour protéger l'intérêt général ou la sauvegarde de certaines formations naturelles.

		3) Il incombe à l'État d'encourager et de promouvoir la pratique et la diffusion du sport et de la culture physique.
	Loi n ° 1/2011 du 2 mars 2011 constituant la loi-cadre sur l'environnement	L'article 31 est consacré aux zones protégées, aux réserves, aux sites, aux ensembles et aux objets classés. Il stipule que la législation spéciale définit la mise en œuvre et la réglementation d'un réseau national d'aires protégées
	Ordonnances n°045/PRG/87 : Code de la protection et de la mise en valeur de l'environnement	Art.4.- L'environnement guinéen constitue un patrimoine naturel, partie intégrante du patrimoine universel. Sa conservation, le maintien des ressources qu'il offre à la vie de l'homme, la prévention ou la limitation des activités susceptibles de dégrader ou de porter atteinte à la santé des personnes et à leurs biens sont d'intérêt général.

2.3. Cadre institutionnel de gestion de l'environnement

2.3.1. La Direction Générale de l'environnement (DGE)

La DGE est l'institution chargée de la mise en œuvre et du suivi de la politique environnementale et de développement durable. Elle a pour mission l'élaboration des éléments de la politique nationale en matière d'environnement et de développement durable. Elle doit également participer au suivi de la mise en œuvre des PGES, des plans, politiques et programmes.

2.3.2. Autorité d'Evaluation Environnementale Compétente (AAAC)

L'Autorité d'Evaluation Environnementale Compétente (AAAC) est rattachée au Secrétariat d'Etat à l'Environnement et au Développement Durable. Elle est chargée de la coordination et du suivi de toute la procédure d'EIES en Guinée Bissau. L'AAAC dispose de compétences humaines réduites dans le domaine des Evaluations et Etudes d'Impact sur l'Environnement même si elle s'appuie sur des institutions sectorielles pour mener à bien sa mission. En effet, elle dispose de points focaux au niveau central de l'administration et au niveau régional également. Ces Points Focaux représentent leurs ministères respectifs lors des séances d'examen et de validation des EIES, animent au sein de leurs départements respectifs la fonction environnementale et veillent à l'intégration des préoccupations environnementales et sociales dans leurs programmes et projets sectoriels. Toutefois, le Secrétariat d'Etat aux transports et Communication ne dispose pas de point focal en environnement.

2.3.3. Direction de la Protection des Végétaux

Les services de la Direction de la Protection des Végétaux (DPV) sont chargé de contrôler les agréments professionnels et les produits phytopharmaceutiques importés et distribués. Le service de la DPV dispose d'antennes régionales antennes à travers les neuf régions. Ces derniers assurent pour le compte de la DPV un contrôle phytosanitaire des pesticides utilisés dans la région. Les contrôles prioritaires sont le contrôle de l'étiquetage et de l'emballage qui, doivent être réalisés au niveau des

magasins de stockage ou des points de distribution des produits (contrôle des formulations et de leur conformité aux étiquettes; contrôle des résidus dans les produits agricoles surtout par rapport aux Limites Maximales de Résidus admises par la Commission du Codex Alimentation de la FAO et de l'OMS; contrôle des agréments des produits ou homologation). Les SDPV a aussi en charge la formation à l'utilisation des produits, mais aussi la gestion des stocks périmés et la réutilisation des emballages. Toutefois, faute de moyens matériels et de laboratoires spécialisés, la plupart de ces contrôles ne s'effectue pas.

2.3.4 Le Comité National de Gestion des Pesticides (CNGP)

Le Comité National de Gestion des Pesticides (CNGP) a été mis en place par le Décret – Loi n° 7/2000 du 24 août 2000 en son article 11. Le CNGP assure, entre autres : (i) la mise en œuvre et le suivi du respect des procédures et normes de contrôle de qualité des pesticides ; (ii) le contrôle post homologation des pesticides ; (iii) le contrôle de conformité des pesticides; (iv) le contrôle de la distribution et de l'utilisation des pesticides ; (v) le contrôle des Limites Maximales de Résidus (LMR) des produits d'importation destinés à la consommation locale ; (vi) le contrôle des professionnels de la filière des pesticides; (vii) la tenue du registre des opérateurs de la filière ; (viii) la tenue et l'actualisation des pesticides homologués ; (ix) la dénonciation des pesticides non homologués entrés dans le pays ; (x) le suivi en matière de toxicovigilance; (xi) le suivi des essais de pré-vulgarisation ; (x) le suivi de la mise en œuvre des conventions internationales relatives aux pesticides.

Plusieurs structures interviennent au sein de ce comité (l'environnement, la santé, les organisations d'agriculteurs, la douane).

**CHAPITRE III : NORMES DE SAUVEGARDE DU FONDS D'ADAPTATION ET
DE LA BOAD**

3.1. Les politiques environnementales et sociales du Fonds d'Adaptation

La politique vise à faire en sorte que dans la poursuite de la mission du Fonds de lutter contre les effets néfastes et les risques posés par le changement climatique, les projets et programmes soutenus par le Fonds ne donnent pas lieu à des dommages environnementaux et sociaux inutiles.

3.1.1. Engagement environnemental et social Général

Les politiques environnementales et sociales sont fondamentales pour assurer que le Fonds ne soutient pas les projets / programmes qui nuisent inutilement à l'environnement, la santé publique ou les communautés vulnérables. Dans le cadre des responsabilités des entités d'exécution du projet / programme, toutes les entités d'exécution devront (i) disposer d'un système de gestion environnementale et sociale qui garantit que les risques environnementaux et sociaux sont identifiés et évalués le plus tôt possible à la conception du projet / programme, (ii) d'adopter des mesures pour éviter ou si l'évitement est impossible de minimiser ou d'atténuer ces risques lors de la mise en œuvre, et (iii) de surveiller et de faire des rapports sur l'état de mise en œuvre de ces mesures pendant et à la fin du projet. Il doit y avoir des possibilités adéquates pour la participation éclairée de tous les intervenants dans la formulation et la mise en œuvre des projets / programmes soutenus par le Fonds.

3.1.2. Principes environnement et sociaux

Tous les projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre pour répondre aux principes environnementaux et sociaux suivants, bien qu'il soit reconnu que, selon la nature et l'ampleur d'un projet / programme tous les principes peuvent ne pas être pertinents pour chaque projet / programme.

- **Respect de la loi/Conformité avec la loi**

Les Projets / programmes soutenus par le Fonds doivent être en conformité avec toutes les lois nationales et internationales applicables.

- **Accès et équité**

Les Projets / programmes soutenus par le Fonds doivent fournir un accès juste et équitable aux avantages d'une manière qui est inclusive et qui ne fait pas obstacle à l'accès aux services de santé de base, l'eau potable et l'assainissement, l'énergie, l'éducation, au logement, aux conditions de travail sûres et décentes, et aux droits

fonciers. Les Projets / programmes ne doivent pas exacerber les inégalités existantes, notamment en ce qui concerne les groupes marginalisés ou vulnérables.

- **Groupes marginalisés et vulnérables**

Les Projets/programmes soutenus par le Fonds doivent éviter d'imposer des effets négatifs disproportionnés sur les groupes marginalisés et vulnérables, notamment les enfants, les femmes et les filles, les personnes âgées, les populations autochtones, les groupes tribaux, les personnes déplacées, les réfugiés, les personnes vivant avec un handicap, et les personnes vivant avec le VIH / SIDA. En faisant le screening de tout projet / programme proposé, les entités d'exécution évaluent et tiennent compte des effets particuliers sur les groupes marginalisés et vulnérables.

- **Droits de l'Homme**

Les Projets / programmes soutenus par le Fonds doivent respecter et le cas échéant faire la promotion des droits de l'homme internationaux.

- **Équité entre les sexes et l'autonomisation des femmes**

Les projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre de manière à ce que les femmes et les hommes (a) sont en mesure de participer pleinement et équitablement; (B) reçoivent des avantages sociaux et économiques comparables; et (c) ne subissent pas des effets négatifs disproportionnés au cours du processus de développement.

- **Droits fondamentaux du travail**

Les projets / programmes soutenus par le Fonds doivent respecter les normes fondamentales du travail telles que définies par l'Organisation internationale du Travail.

- **Peuples autochtones**

Le Fonds ne doit pas soutenir des projets / programmes qui sont incompatibles avec les droits et responsabilités énoncés dans la Déclaration des Nations Unies sur les droits des peuples autochtones et des autres instruments internationaux applicables relatifs aux peuples autochtones.

- **Réinstallation Involontaire**

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre d'une manière qui évite ou réduit le besoin de réinstallation involontaire. Lorsque la réinstallation involontaire limitée est inévitable, une procédure régulière doit être

observée afin que les personnes déplacées soient informées de leurs droits, consultées sur leurs options, et offertes techniquement, économiquement et socialement de possibles alternatives de réinstallation ou une indemnisation équitable et adéquate.

- **Protection des habitats naturels**

Le Fonds ne doit pas soutenir les projets / programmes qui impliqueraient la conversion injustifiée ou la dégradation des habitats naturels critiques, y compris ceux qui sont (a) protégés par la loi; (B) officiellement proposés pour la protection; (C) reconnus par des sources faisant autorité pour leur haute valeur de conservation, y compris comme habitat essentiel; ou (d) reconnus comme protégés par les communautés locales traditionnelles ou autochtones.

- **Conservation de la diversité biologique**

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre d'une manière qui évite toute réduction significative ou injustifiée ou la perte de la diversité biologique ou l'introduction d'espèces envahissantes connues.

- **Changement climatique**

Les Projets / programmes soutenus par le Fonds ne doivent pas entraîner une augmentation significative ou injustifiée des émissions de gaz à effet de serre ou d'autres facteurs de changement climatique.

- **Prévention de la pollution et l'efficacité des ressources**

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre d'une manière conforme aux normes internationales en vigueur pour maximiser l'efficacité énergétique et en réduisant la matière d'utilisation des ressources, la production de déchets et les rejets de polluants.

- **Santé publique**

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre de manière à éviter les impacts négatifs potentiellement importants sur la santé publique.

- **Patrimoine Physique et culturel**

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre d'une manière qui évite l'altération, le dommage, ou la suppression de toutes les ressources culturelles physiques, les sites culturels et les sites avec des valeurs

naturelles uniques reconnues comme telles au niveau communautaire, national ou international. Les Projets / programmes ne devraient pas interférer de façon permanente avec l'accès et l'utilisation de ces ressources physiques et culturelles existantes.

- Terres et Conservation des sols

Les Projets / programmes soutenus par le Fonds doivent être conçus et mis en œuvre d'une manière qui favorise la conservation du sol et évite la dégradation ou la conversion des terres ou des terres productives qui fournissent des services écosystémiques précieux.

3.1.3. Interrelation entre les Normes/principes E&S du Fonds d'Adaptation et le cadre juridique de la Guinée Bissau

Le tableau suivant indique les interrelations ou correspondances entre les principes environnementaux et sociaux du Fonds d'Adaptation et les textes juridiques de la Guinée Bissau ainsi que les conventions auxquelles il a signé et ratifié.

3.2. Normes de sauvegarde de la BOAD applicables au projet

- **Politique opérationnelle en matière d'étude d'impact environnemental et social**

La Banque Ouest Africaine de Développement (BOAD) demande que les projets qui lui sont présentés pour financement fassent l'objet d'une étude d'impact

environnemental et social (EIES) qui contribue à garantir que lesdits projets sont rationnels sur le plan environnemental et socialement viable pour faciliter le processus de décision.

L'Étude d'impact environnemental et social (EIES) est un processus, dont l'ampleur, la complexité et les caractéristiques sur le plan de l'analyse dépendent de la nature et de l'échelle du projet proposé, et de l'impact qu'il est susceptible d'avoir sur l'environnement. Elle consiste à évaluer les risques que peut présenter le projet pour l'environnement et les effets qu'il est susceptible d'exercer dans sa zone d'influence, à étudier des variantes du projet, à identifier des moyens d'améliorer la sélection du projet, sa localisation, sa planification, sa conception et son exécution en prévenant, en minimisant, en atténuant ou en compensant ses effets négatifs sur l'environnement, et en renforçant ses effets positifs.

Le client³, agissant de commun accord avec les agences gouvernementales responsables et les autres parties prenantes appropriées⁴, mènera un processus d'étude d'impact environnemental et social, mettra en place et maintiendra un Système de gestion environnementale et sociale (SGES) adapté à la nature et à l'échelle du projet et proportionnel aux risques et aux impacts environnementaux et sociaux. Le SGES comprend les éléments suivants : (i) énoncé de Politique ; (ii) identification des risques et des impacts ; (iii) programme de gestion ; (iv) capacité organisationnelle et compétences ; (v) préparation et réponse aux situations d'urgence ; (vi) engagement des parties prenantes ; et (vii) suivi et évaluation.

L'EIES inclut aussi le processus d'atténuation et de gestion des nuisances pendant toute la durée de l'exécution du projet. La BOAD préconise l'emploi de mesures préventives de préférence à des mesures d'atténuation ou de compensation, chaque fois que cela est possible.

- **Politique opérationnelle sur les habitats naturel**

Selon cette politique, la BOAD encourage et appuie la conservation des habitats naturels ainsi qu'un meilleur aménagement du territoire en finançant des projets conçus de manière à intégrer dans les stratégies de développement national et régional la protection des habitats naturels et leur réhabilitation, en cas de dégradation, en vue de garantir leurs différentes fonctions (par 3 de cette politique).

³ Le terme « client » est utilisé au sens large dans toutes les Normes de sauvegarde environnementale et sociale pour désigner la partie responsable de l'exécution et de l'exploitation du projet financé, ou le bénéficiaire du financement, selon la structure du projet et le type de financement accordé.

⁴ Il s'agit des parties obligées et ayant la responsabilité, aux termes de la loi, d'évaluer et de gérer des risques et des impacts déterminés (par exemple, des activités de réinstallation organisées par l'État).

La BOAD n'apporte pas son appui aux projets qui, selon elle, impliquent une modification ou une dégradation significative d'habitats naturels critiques.

Partout où c'est possible, les projets financés par la BOAD sont situés sur des territoires dont l'état naturel a déjà été modifié (à l'exclusion de toutes zones naturelles converties, selon la BOAD, en prévision du projet). La BOAD ne prête son concours aux projets impliquant une dégradation significative d'habitats naturels que s'il n'existe aucune alternative réaliste au projet et à son emplacement, et qu'à condition qu'une analyse exhaustive ait démontré que les bénéfices tirés du projet seront substantiellement supérieurs aux coûts environnementaux.

La décision de la BOAD d'apporter ou non son soutien à un projet susceptible d'avoir des impacts négatifs sur un habitat naturel prend en compte la capacité des Emprunteurs à mettre en œuvre les mesures appropriées de conservation de la nature et d'atténuation des effets négatifs sur l'environnement et sur le milieu social. S'il existe des problèmes potentiels de capacités institutionnelles, le projet inclut des composantes de développement des capacités institutionnelles⁵ nationales et locales à même d'assurer une planification et une gestion environnementale et sociale efficaces. Il est possible d'utiliser les mesures d'atténuation spécifiées pour un projet donné pour accroître les aptitudes pratiques des institutions nationales et locales sur le terrain.

- **Politique opérationnelle sur le Patrimoine culturel**

La politique vise à aider les emprunteurs à protéger et à mettre en valeur le patrimoine culturel présent dans les projets que la BOAD finance. Il s'agit d'éviter ou atténuer les effets négatifs que les projets de développement peuvent avoir sur les biens culturels physiques. Les effets sur ces biens résultants des activités des projets ne doivent pas être contraires à la législation nationale de l'emprunteur, ni aux obligations qui lui incombent en vertu des traités et accords internationaux applicables dans le domaine de l'environnement⁶.

L'analyse de l'impact sur les biens culturels physiques d'un projet pour lequel un financement de la BOAD est envisagé, fait partie intégrante de l'étude d'impact environnemental et social (EIES). Cette analyse est faite par l'Emprunteur. Le déroulement de l'EIES suit les étapes suivant: examen préalable, élaboration de termes de référence (TdR), collecte de données de référence, évaluation d'impact

⁵ Voir *Directive de la Banque sur le renforcement des capacités institutionnelles* pour amples informations

⁶ Y compris la Convention pour la protection du patrimoine mondial, culturel et naturel de 1972 (UNESCO, Convention sur le patrimoine mondial).

et formulation de mesures d'atténuation et d'un plan de gestion environnementale et sociale (PGES).

Cette politique décrit également les procédures applicables en cas de découvertes fortuites des biens culturels physiques.

- **Politique opérationnelle sur la lutte antiparasitaire**

Pour gérer au mieux les impacts pouvant résulter de la mise en œuvre des projets dont la Banque finance et qui comportent directement ou indirectement l'usage des pesticides, la Banque a développé une Politique opérationnelle sur la lutte antiparasitaire.

Dans sa politique, la BOAD privilégie une stratégie qui encourage l'utilisation de méthodes biologiques ou environnementales et limite le recours aux pesticides chimiques de synthèse. Et, dans les projets financés par la BOAD, l'Emprunteur traite de la lutte antiparasitaire dans le cadre de l'Étude d'impact environnemental et social réalisée à l'occasion du projet (Paragraphe 1).

Dans les opérations agricoles financées par la BOAD, la lutte antiparasitaire a normalement un caractère intégré, faisant intervenir des méthodes telles que le contrôle biologique, les façons culturales et la mise au point et l'utilisation de variétés résistantes ou tolérantes. La BOAD peut financer l'achat de pesticides lorsque leur utilisation se justifie dans le cadre d'une stratégie de lutte phytosanitaire intégrée (paragraphe 4).

En son paragraphe 6, la politique stipule que, l'achat de tout pesticide dans le cadre d'un projet financé par la BOAD est subordonné aux résultats d'une évaluation et de la nature et de l'importance des risques encourus, en fonction de l'utilisation envisagée et des utilisateurs prévus. S'agissant de la classification des pesticides et des formules propres à chacun des produits considérés, la BOAD se réfère aux lignes directrices pour la classification des pesticides par risque telle que recommandée par l'Organisation mondiale de la santé (OMS).

Cette politique définit également les critères de sélection et d'utilisation des pesticides. Les critères applicables à la sélection et à l'utilisation des pesticides dans le cadre des projets que finance la BOAD sont les suivants :

- Les produits retenus doivent avoir des effets négligeables sur la santé humaine.
- Leur efficacité contre les espèces visées doit être établie
- Ils doivent avoir des effets très limités sur les espèces non ciblées et sur l'environnement. Les méthodes, le moment de l'intervention et la fréquence des applications doivent permettre de protéger au maximum les ennemis naturels. Il doit être démontré que les pesticides utilisés dans le cadre des programmes de

santé publique sont inoffensifs pour les habitants et les animaux domestiques dans les zones traitées, ainsi que pour le personnel qui les applique.

- Leur utilisation doit tenir compte de la nécessité de prévenir l'apparition d'espèces résistantes.

- Politique opérationnelle en matière de participation du public dans le processus d'étude d'impact environnemental et social

La politique de la Banque Ouest Africaine de Développement relative à l'étude d'impact environnemental et social exige, que les groupes concernés ainsi que les ONG locales soient informées et consultés d'une manière réelle lors de la réalisation d'une étude d'impact environnemental et social.

La politique opérationnelle en matière de participation du public dans le processus d'étude d'impact environnemental et social décrit les procédures et les types de consultation requise durant l'étude d'impact environnemental et social. Pour les projets de catégorie B, la consultation publique est organisée une fois durant l'étude d'impact environnemental afin de prendre en compte leur avis et préoccupations.

Dans le cadre du projet, quatre séries de consultations publiques ont été conduites :

- Consultation publique au cours de la préparation du PCN
- Consultation publique lors des études sur les leçons apprises du projet LDCF en cours d'achèvement
- Consultation publique lors de l'identification des sites potentiels
- Consultation publique durant la préparation du Full projet, du Cadre de gestion environnementale et sociale et du Plan de gestion des pestes et pesticides.

Seule la liste de consultation publique lors de la préparation du Cadre de gestion environnementale et sociale est jointe en annexe de ce document. Les listes complètes de toutes les consultations publiques sont jointes en annexe du document complet du Projet (Full Project).

CHAPITRE IV. MÉCANISMES DES CONSULTATIONS PUBLIQUES

4.1. Démarche de consultation publique

Ce chapitre présente la démarche de communication adoptée dans le cadre de cette étude afin de tenir informés les principaux acteurs du projet. Cette démarche de communication et de participation soutient et s'intègre directement à l'évaluation environnementale du projet.

Globalement, le principal objectif de la démarche d'information, de communication et de participation des parties prenantes est de créer, un climat d'échanges mutuellement bénéfiques, favorable à un dialogue ouvert, ayant pour objectif de minimiser les impacts et nuisances sur l'environnement biophysique et humain par des mesures appropriées d'atténuation, de compensation et de collaboration environnementales et sociales.

L'étude a été réalisée sur la base d'une approche méthodologique participative qui s'est appuyée, d'une part, sur des visites de terrain, et d'autre part, sur les entretiens avec l'ensemble des acteurs et bénéficiaires du projet. Il s'agit notamment des : élus locaux, autorités administratives, services techniques, populations locales, etc. (voir liste des personnes rencontrées en annexe). Ces consultations publiques se sont déroulées dans les régions couvertes par le projet (Gabu et Bafatà).

L'approche de consultation publique adoptée, comporte deux étapes :

a) **Première étape** :

Information sur le contenu du projet : Durant la première étape, les bénéficiaires ont été largement informés sur les objectifs et activités du projet. Ces rencontres ont été réalisées dans chaque région d'intervention du projet avec des représentants des services techniques (agriculture, environnement, génie rural, hydraulique, les représentations régionales des chambres d'Agriculture et les organisations paysannes etc.) et avec des représentants des collectivités territoriales (Communes).

b) **Deuxième étape**:

Pendant la deuxième étape, des séances de consultations avec les acteurs ont été organisées au niveau local. C'est ainsi que des rencontres publiques avec les

communautés locales ont été organisées dans certains grands centres de regroupements. La démarche utilisée au cours de ces consultations consistait également à : (i) présenter le projet (justification, objectifs, activités envisagées, résultats attendus du projet, (ii) recueillir les points de vue, les préoccupations et les suggestions émises par les bénéficiaires. La technique d'animation utilisée a permis d'orienter les débats vers l'expression des attentes et préoccupations que les activités envisagées pourraient éventuellement soulever.

4.2. Consultations publiques conduites

La consultation du public durant la préparation du projet a été menée conformément aux exigences du Fonds pour l'adaptation.

Cette consultation s'est déroulée en plusieurs phases:

- une première consultation a été menée lors de la préparation de la note conceptuelle du projet (PCN);
- une seconde consultation lors de l'étude sur les leçons apprises du projet LDCF en cours d'achèvement;
- une troisième lors de l'identification des sites potentiels du projet; et
- Une quatrième lors de la préparation du Full Project.

L'objectif est de rechercher les points de vue des bénéficiaires et de recueillir les informations de base pour permettre une meilleure conception du projet avec une implication particulière des groupes vulnérables, des aînés, des femmes et des jeunes.

L'objectif principal de cette approche de l'information, de la communication et de la participation des parties prenantes était de créer des échanges mutuellement bénéfiques, favorables à un dialogue ouvert visant à: (i) la propriété du projet par les bénéficiaires au stade de la préparation et de la planification; (ii) l'examen des préoccupations de toutes les parties prenantes, y compris les groupes vulnérables (femmes, jeunes, enfants, etc.) dans la conception et la mise en œuvre du projet; (iii) échanges sur le financement et la durabilité des projets.

Au cours de la préparation du projet, une revue de la littérature a été réalisée. Des entretiens avec des personnes-ressources travaillant dans différents ministères et structures concernés ont été réalisés. Des visites sur le terrain (sites potentiels et sites en exploitation) et des entretiens avec les bénéficiaires ont été effectués. Cela a permis d'établir de manière participative le contexte de développement des

projets, les problèmes à résoudre, les types de solutions adaptées, etc., et la prise en compte des problèmes des populations vulnérables.

a) Consultation publique lors de la préparation du PCN

Le processus consultatif pour le développement de projets repose sur les réseaux établis dans le cadre du PANA et de la SNCCC et, en outre, le projet FEM / PNUD «Renforcer la capacité d'adaptation et la résilience au changement climatique dans les secteurs agricole et des ressources hydriques en Guinée-Bissau» (00077229). Des ateliers et des réunions ont eu lieu à Bissau avec divers ministères et institutions, en plus des consultations avec le Forum rural sur le changement climatique de la région du projet (RCCF, voir section III) et d'autres autorités locales / régionales. En outre, une journée de travail d'une semaine a été organisée par DGA / SEAD en 2015 afin de recevoir des commentaires sur les activités et les besoins du projet. La visite sur le terrain a porté sur les communautés extrêmement pauvres et l'intégration des femmes (organisées en associations ou non) qui sont un objectif central dans le cadre de ce projet.

Dans chaque village visité, suivant les habitudes locales, l'équipe du projet a commencé par demander au chef du village la permission de présenter l'idée du projet, puis lui a demandé d'appeler tous les chefs de ménage pour participer à une réunion de groupe. Des conversations ont été menées en Guinée-Bissau Kriol par l'équipe du projet ou dans n'importe quelle langue / dialecte local lorsque les participants de l'équipe ne maîtrisaient pas la langue vernaculaire. Ces réunions comprenaient des présentations claires de l'idée et des objectifs du projet ainsi qu'un inventaire des besoins des ménages et des villages (en se concentrant sur l'agriculture intersectorielle, les ressources en eau et la gestion des risques climatiques). Par cette approche, le choix précis de la stratégie d'adaptation est fait par les communautés elles-mêmes - à l'exemple de l'approche de la Banque mondiale et celle des autres, qui ne précisent pas les activités avant les ateliers, les projets des ONG et une liste typologique des activités qui pourraient être discutées au Communautaire. La participation et l'autonomisation des femmes à travers le projet ont également été discutées ouvertement où les aînés et les chefs de village ont jugé cela problématique.

Ils donnent l'idée que la voix et l'opinion des femmes et des pauvres ont été promues au cours du processus de consultation. Au cours de cette série de consultations, l'élément sexospécifique était très présent (voir la figure 4 ci-dessous).

b) Consultations Durant l'étude sur les leçons apprises du projet LDCF en cours d'achèvement

Cette consultation publique s'est déroulée dans les villages bénéficiaires dudit projet. L'objectif étant de recueillir l'appréciation faite des bénéficiaires sur ce projet. La démarche adoptée et la libre échanges entre bénéficiaires d'une part et entre bénéficiaires et l'équipe d'étude d'autres part. Ceci a permis aux bénéficiaires de relever eux-mêmes les réussites, les défaillances et les points pouvant être améliorés.

c) Consultation publique durant les travaux d'identification des sites potentiels

Lors de l'identification des sites potentiels pour le projet, plusieurs villages ont été visités et des consultations avec les populations locales ont été réalisées. L'objectif était de partager les idées du projet avec ces populations afin de les informer des possibilités offertes par le projet. Dans chaque village, les sites qui pourraient être mis en valeur ont été visités. À la suite de cette série de visites de sites et de consultations publiques, des sites potentiels ont été identifiés.

d) Consultation publique durant la phase de préparation du projet complet

Au cours de la phase de préparation du projet Full, une large consultation des parties prenantes a été menée. Dans les villages potentiels touchés par le projet, des rencontres avec les populations locales ont été organisées afin d'échanger avec eux sur les aspects du projet, leurs opinions et leurs préoccupations. Ces réunions ont été suivies par près de 500 personnes au total. La consultation publique a également concerné les villages ont bénéficié du projet LDCF. Le but des réunions tenues dans les villages bénéficiaires du projet LDCF est de partager avec les gens les expériences et les leçons apprises du projet (forces et faiblesses au plan technique et organisationnel). Les chefs des villages ont été fortement impliqués dans les consultations publiques. Des réunions d'échange ont eu lieu à Bissau, Gabù et Bafatà. Ces réunions ont rassemblé les responsables des différents secteurs impliqués dans le projet. Il s'agit, entre autres, des services: environnement, agriculture, forêts et faune, élevage, pêche, défense civile et ONG. Des réunions ont également eu lieu avec les autorités administratives régionales et sectorielles. L'équipe a donc rencontré le gouverneur de Gabù, le gouverneur de Bafatà, l'administrateur du secteur Contuboel (région de Bafatà), l'administrateur du secteur Pirada (région Gabù), le secrétaire de l'administrateur du secteur Bambadinca (région de Bafatà).

Photos de consultation des acteurs durant la préparation du projet

4.3. Diffusion de l'information au public

La communication des rapports relatifs au processus d'évaluation environnementale de la BOAD aux parties prenantes et autres parties concernées par le projet devra respecter les mêmes procédures que celles actuellement appliquées à la divulgation des rapports de conception. Conformément à la législation Bissau-guinéenne et à la Politique de la BOAD en matière de diffusion des documents, les rapports (CGES et PGIPP) seront mis à la disposition des parties prenantes et autres parties concernées, sous réserve de l'approbation de la Guinée Bissau. Ainsi, pour se conformer aux dispositions réglementaires, le CGES sera mis à la disposition des personnes bénéficiaires et des acteurs institutionnels concernés.

**CHAPITRE V : CARACTERISTIQUES BIOPHYSIQUES ET SOCIO-
ECONOMIQUES DES ZONES DU PROJET**

5.1. Localisation du projet

Le projet couvre les régions de Bafata et Gabu. Ces deux régions forment l'Est Bissau-Guinéen. Les deux régions couvrent une superficie totale de 15131,1 km² (5.981,1 km² pour Bafatà et 9.150 km² pour Gabù) soit 41,88 % du territoire Bissau-guinéen. Elles totalisent une population de 440 036 habitants. Les secteurs administratifs de Pitche, Pirada, Gabú, Sonaco, Contuboel et Ganadu sont concernées.

La Région de Bafata est limitée au Nord par le Sénégal, au Sud par la Région de Oio à l'Est par la Région de Gabú. La région de Gabú quant à elle est limitée au Nord par le Sénégal, à l'Est et au Sud par la Guinée Conakry, à l'Ouest par la Région de Bafatà.

A ce stade, certains sites potentiels (18 au total) ont été identifiés pour être aménagés dans le cadre du projet. Le rapport d'identification de ces sites est joint en annexe 2 du présent document. Avant le démarrage du projet, un appel à projet sera lancé pour identifier d'autres sites et sélectionner les bénéficiaires définitifs du projet.

Les groupes cibles du projet sont des groupes vulnérables au changement climatique formés d'agricultures dans une forte proportion. Les éleveurs étant le deuxième groupe le plus vulnérable.

5.2. Environnement biophysique

5.2.1. Caractéristiques climatique de la zone d'intervention

Le climat des régions de Bafata et Gabú est de type soudanien se caractérise par l'alternance d'une courte saison des pluies (de juin à Octobre) et d'une longue saison sèche (novembre à mai).

- Précipitation

La pluviométrie moyenne est de 1 500 mm/an avec un maximum en Août (plus de 400 mm), mais les écarts, d'une année à l'autre, peuvent être très importants, pouvant aller du simple au double.

Une analyse de l'évolution des précipitations annuelles montre qu'au cours des dernières années, on assiste à une baisse marquée des pluies (en hauteur annuelle et en nombre de jours de pluies). Cette variabilité d'une année par rapport à

l'autre, mensuellement, particulièrement dans les dates d'apparition des premières pluies, dans la fin de la saison pluvieuse et dans la répartition de ces pluies au cours des cycles culturaux, rend aléatoire la production agricole.

- **Température**

Les moyennes mensuelles sont sensiblement constantes d'une année à l'autre, et sont comprise entre 24^o C et 30^o C. Mais, les maxima et minima atteignent des écarts élevés : à Bafata, les moyennes s'échelonnent entre 30^o et 39^o C pour les maxima, avec des valeurs absolues de l'ordre de 42-43^o C (en mars ou avril) et entre 15 et 23^o C pour les minima, et des valeurs absolues pouvant tomber jusqu'à 10-12^o C (en décembre ou janvier). En général, dans la journée, l'heure le plus chaude se situe entre 14 et 15 h, et les heures les plus fraîches entre 5 et 7 h.

- **Humidité**

L'humidité moyenne mensuelle se situe entre 46 et 80%. La moyenne annuelle étant de 62%.

5.2.2. Pédologie

En raison de la relatives homogénéité du substrat sableux, la différenciations des sols est principalement liées aux conditions de régimes hydrique :

- lessivage dominant et faible érosion en nappe (sols sableux profonds sur plateaux) ;
- lessivage et hydromorphie temporaire (sols peu profonds sur cuirasses de plateaux) ;
- érosion en nappe, colluvionnement et hydromorphie (versant à pente faible) de bas de pente
- érosion en nappe, localement en ravines (versant à pente forte).
- démantèlement et colluvionnement de cuirasse
- hydromorphie généralisée de nappe ou inondation (vallée, dépression).

On trouve des sols ferralitiques et ferrugineux, tropicaux, sur les plateaux. Ces sont les plus fréquents. Ils peuvent être rouges, beiges ou jaunes, selon le degré d'oxydation du fer. Les sols rouges ferralitiques et profonds se rencontrent principalement dans les zones hautes notamment sur les plateaux et les sommets de collines.

Les sols ferrugineux tropicaux sont généralement associés à des cuirasses ou horizons gravillonnaires, situés en profondeur. Les terrasses sont fréquentes et peuvent affleurer, notamment en rupture de pente.

On rencontre également :

- des lithosols associés aux cuirasses et affleurements rocheux (surtout de part et d'autre du Corubal).
- des sols peu évolués d'érosion, associés aux cuirasses et horizons gravillonnaires démantelés
- des sols peu évolués d'apport, associés aux alluvions ou colluvions de toutes sortes.
- des sols hydromorphes à gley, pseudogley, des vallées et dépressions.

5.2.3. Ressources naturelles

La destruction de la couverture végétale par des incendies, les incendies, l'agriculture itinérante et l'exposition de la surface au soleil et à la pluie, ce qui réduit l'équilibre et menace la fertilité actuelle des sols. Cependant, la productivité du sol dépend du type de culture. En dépit de cette constatation, la sylviculture, fournit les plantes, du bois et des fruits sauvages.

La production artisanale et industrielle du bois est dominée par les marchands de bois domestique et une grande majorité des marchands de bois est d'origine illégale, certains en provenance des républiques voisines, avec une certaine complicité nationale. La plupart de la population «indigène» oriente leurs exploitations forestières pour la production d'huile et de vin de palme, les matériaux de construction, les plantes médicinales et la collecte de fruits avec des techniques obsolètes dures, sans le moindre souci de rationalité et de la conservation.

5.2.4. Ressources agro- pastorales

L'agriculture représente une valeur importante dans l'économie des ménages, national, régional et local. Elle servait toujours des bases dans son développement. Elle est pratiquée principalement pour la majeure partie de la population active des régions (environ 80%), une pratique nécessaire à la survie des familles et des producteurs visant à approvisionner en premier lieu les familles et les surplus aux marchés nationaux et étrangers.

Les populations se consacrent aussi à la culture des céréales, des tubercules, des légumes et des fruits. La culture est pratiquée dans tous les trois écologies : les plateaux, les bas-fonds et les mangroves (sud- Bafata), et les revenus d'activités

servent pour assurer la subsistance des familles. D'autre part, la période de projet chinois (1992-2002), il y a eu une expansion de la production de riz au niveau des bas-fonds, grâce à l'aménagement de cette ci, pratique presque abandonnée par les agriculteurs citant le manque d'intrants agricoles. Actuellement, en raison de sa valeur commerciale, la récolte de noix de cajou (produit agricole d'exportation national principal), a étendu à la terre appropriée pour d'autres cultures, notamment les céréales et les tubercules.

5.2.5. L'élevage

L'élevage est également pratiqué par la plupart de la population des régions à l'échelle familiale et différenciée selon le type d'animaux. Les poulets sont la production de la famille, car il est facile à exploiter. La production de petits et grands ruminants, est dominé par les Peuls (habitants majoritaires de ces régions), sous forme extensive. La région de Gabú est considérée comme la région qui a le plus grand nombre de bovins, de chèvres et champ poulets, suivi de la région de Bafata. Les deux régions détiennent environ 70% d'élevages bovins du pays.

5.2.6. Ressources fauniques et halieutiques

La pêche est la dimension artisanale traditionnelle, pratiquée sur les rivières et les lacs. Elle est l'une des activités génératrices de revenus et en termes d'occupation de la population active dans les régions, confinée à la rivière Corubal et Gêba, avec une certaine expression dans les villages de Tchetché, de Cabuca et Fulamori et plus, dans l'étang " de Wendo Tcham " dans secteur de Boé. Ainsi au long du rivière Geba avec certaine expression dans la ville de Bafata et villages de Gambiel, de Contuboel et de Sonaco. La faune est des espèces menacées très diverses et nombreuses. Les deux régions ont été traversées par Parc Tchetché - Dulombi (aire protégée). Les marchés des deux régions, surtout ces de la région de Gabú, souffrent de manque important de poisson.

5.3. Dynamiques socioculturelles

La dynamique socio-culturelle des régions se caractérise par la présence de nombreuses organisations sociales. En effet, depuis les années 80, la présence des partenaires bi et multilatéraux de développement de la Guinée-Bissau se fait sentir, la création d'une entreprise de collecte de l'eau, ENAFUR à Gabú, le projet de développement rural de province de l'est (PDRL), Projet Agro-sylvo-pastoral (PASP),

département de production du riz (DEPA à Contuboel), scierie de Gambiel, et dont les interventions ont contribué beaucoup dans le développement socio-économique de la province. Avec la création de projet d'appui au développement régional et local (PADRL) à Gabú vise entre autres, de créer un environnement local favorable, compte tenu de l'urgence, une mise en page du système et de base de gestion des services locaux dans les collectivités locales rurales, urbaines et régional. Sa stratégie repose sur le développement d'instruments locaux et régionaux, ainsi que la formation des autorités locales à venir dans leurs fonctions de développement et de fournir des services publics locaux et régionaux. Avec une composante du projet de gestion des déchets dans la ville de Gabú.

Les actions des ONGs ont été très tôt senties, en particulier dans le développement communautaire, qui agit par la DIVUTEC les sources de crédit , l'économie et l'animation du développement micro ; par l'ADIC NAFAIA dans le secteur de l'éducation et de l'agriculture ; par ASPAG , l'assainissement de base et de la collecte des déchets solides municipaux dans la ville de Gabú; par AL-Ansar, l'organisation de l'aide à la communauté islamique , en particulier les femmes dans l'horticulture , les fruits et la production agricole ; par la SAFRA , organisation sous régionale de la culture et des sports pour le changement de comportement ; existent dans tous les secteurs différents ONG, des organisations de jeunesse et les femmes interviennent dans chaque emplacement . Avec la fin de ces projets majorité des ONGs et les activités initiées sont disparues.

5.4. Infrastructures de communication

Les régions de Gabú et de Bafata sont relativement bien favorisée dans les infrastructures de communication devrait fournir un environnement favorable au développement. Cela est particulièrement les routes, les radios (RDN, Radios communautaires à Bafata, Contuboel, à Gabu et Pitche) et les réseaux téléphoniques mobiles (MTN et Orange). Les Régions de Bafata et Gabú sont traversées par la route nationale goudronnée qui lie Bissau-Bafata-Gabú environ 200 kms et Bissau-Bambadinca-Xitole-Buba plus de 300 kms et pistes ruraux liant les sièges Régionaux aux secteurs Administratives et des villages toutes en état avancés de dégradations. Certains villages sont de difficiles accès pendant la période des pluies.

Cependant les médias ne couvrent pas toute la zone. Plusieurs villages n'ont pas accès des antennes radiophoniques et audio-visuelles. Les réseaux téléphoniques ne sont pas stables. En particulier, les zones de production sont bloqué ; qui, d'une part, il ne permet pas un bon écoulement du produit et contribue en outre à

maintenir les coûts de transport élevés, ce qui entraîne la compétitivité des produits locaux.

5.5. Activités économiques / commerce

Malgré les difficultés inhérentes au contexte climatique et enclavement, l'économie de la Province a un important potentiel de création d'emplois dans les secteurs du commerce, de l'agriculture, la création du bétail, l'artisanat et des services.

Malheureusement, la région est confrontée à la faible capacité financière des opérateurs économiques, avec le comportement réfractaire de certains groupes sociaux pour certains types de travaux, avec le manque de main-d'œuvre qualifiée en raison du manque de centres de formations techniques et opérationnelles efficace.

Le commerce est une activité relativement développée dans la Province grâce à sa situation géographique signifie que les frontières des 3 pays voisins, et la plupart des transactions fonctionne sur le marché hebdomadaire ou "lume". La plupart espace commercial est situé à Gabu

D'autres contraintes au développement du sous- secteur du commerce sont les suivants:

- Les enclavements et le faible trafic routier pour l'écoulement de la production nationale,
- Le faible pouvoir d'achat des ménages ;
- Productions faibles au cours des dernières années pour réduire le volume des transactions ;
- les recettes fiscales faibles générées par le marché et le "lumo " en raison du manque d'organisation et de planification du marché, ce qui ne facilite pas la bonne perception des impôts.

5.6. Analyse des contraintes

- Domaine de l'alimentation en eau

La satisfaction des besoins en eau potable de la population dans le milieu rural et la région à long terme est encore loin d'être satisfaite. Dans la région de Bafata la couverture est de 68%, selon le Service Régional des Ressources Hydrique de Bafata. Au niveau de la Région de Gabú, 63% de la population consomme de l'eau provenant de puits traditionnelles avec forte probabilité de contamination. Ceci est une contamination directe des toilettes rails d'infiltration contaminées et des eaux

usées. L'accès à l'eau potable de bonne qualité et en quantité suffisante, ainsi que l'évacuation des eaux usées et des déchets solides et liquides, il est essentiel, condition indispensable pour la santé humaine et animal.

Au niveau de la région de Gabú et dans les zones rurales, ont 455 forages d'eau avec pompe à main, 85 puits avec pompe à main, 135 puits améliorés, de rail et 9.324 latrines traditionnelles.

Au niveau de la Région de Bafata ont 860 forages avec pompe.

Au niveau des centres urbains à l'eau courante atteignent seulement une minorité de personnes. La plupart des populations consomment de l'eau des puits traditionnels.

- **Domaine de l'assainissement**

Comme indiqué ci-dessus, la plupart des Secteurs et tous les villages des régions de Gabú et Bafata n'ont à pas de système routier en bon état.

En dehors de l'axe principal de la capitale Bissau-Bafata- Gabú (route nationale) qui traverse Gabú et Bafata, le passage de la rue de gouvernements régionaux de, toutes les autres routes sont à l'état naturel, à savoir les pistes de terre.

La route joue cependant un rôle essentiel au jour le jour des populations: l'espace social, les petites entreprises, d'accès interurbain et rural moyen de l'assainissement, etc.

En ce qui concerne plusieurs réseaux qui sont complémentaires des routes urbaines sont en aucune façon adaptée à la réalité sur le terrain. Par conséquent, la conception d'une attribution de terres à urbaniser doit être accompagné d'au moins une étude de faisabilité dans les réseaux d'infrastructures publiques : adduction d'eau potable, l'évacuation des eaux pluviales, les travaux de réseaux de services d'électricité (ou renouvelable) et les télécommunications.

Faute de financement, ces réseaux sont bien inférieurs à l'attente de la population et ne suivent pas leur dynamique.

- **Domaine d'accès de l'énergie**

L'énergie est un élément essentiel pour la promotion du développement visant à réduire la pauvreté dans les régions. Pour le secteur de l'énergie, l'objectif spécifique

doit être basé sur la planification stratégique, effectué à partir de l'analyse des coûts et des avantages sociaux, économiques et environnementaux.

Le nombre de consommateurs qui se tournent vers les générateurs privés comme un moyen d'obtenir de l'électricité, dans les régions est importante. Ces générateurs, diesel, sont insuffisantes pour les besoins locaux et se révèlent être une alternative à la fois coûteuse comme nuisible à l'environnement. La fourniture d'électricité à toutes les régions est pratiquement inexistante. Ce type d'alimentation existe que dans les zones urbaines et dans certaines maisons et presque il n'y a pas toujours secteur. Fait référence aux générateurs individuels.

- **Domaine de la santé**

La fourniture de services de santé dans les deux régions est insuffisante. Les services de santé sont concentrés sur une petite fraction du territoire (ville de Gabú et de Bafata et dans certains villages) ce qui signifie qu'une grande partie de la population, principalement dans les communautés rurales n'ont pas en effet l'accès. À la suite de ce cadre, les données récentes montrent que le taux de mortalité infantile est parmi les plus élevés dans le pays. Étant donné que le taux de fécondité, également le plus élevé dans le pays, prouve que la situation épidémiologique révèle l'existence de taux de morbidité et de mortalité élevés apportés à des facteurs environnementaux, en particulier avec les mauvaises conditions sanitaires.

La faiblesse de l'offre et la qualité des services d'eau, rejets urbains, les déchets solides et les conditions de logement inadéquates sont associées à des cas extrêmement élevés de maladies telles que la diarrhée, les vers intestinaux, l'hépatite, les infections de la peau. Font partie de cette situation sanitaire entre outre, des maladies telles que le paludisme, la tuberculose, l'hépatite B, la fièvre jaune, avec une incidence plus élevée dans les périodes pluvieuses. Voulait faire croire que la diarrhée est la maladie qui touche plus la population et que l'information sur le VIH / SIDA et d'autres maladies sexuellement transmissibles sont dues à la précarité des systèmes d'information et d'enregistrement.

Le mauvais état de santé parmi les questions prioritaires auxquelles la population est confrontée La gravité de cette situation se reflète dans le manque d'accès aux soins de santé, en particulier parce que le revenu de la population est insuffisante, le manque d'assurance maladie, les faibles moyens disponibles dans les services sanitaires, manque des infrastructures sanitaires comme les latrines et eau courent et sources d'eau potable, etc. Faute de mieux, les habitants se tournent régulièrement vers les guérisseurs traditionnels et les voyants, qui vendent souvent des produits après le délai légal. La population semble également ignorer que les

pratiques d'hygiène et d'assainissement sont indispensables pour préserver la bonne santé.

- **Domaine de l'agriculture**

L'économie de la région repose sur le secteur primaire. Les principales activités sont l'agriculture (principalement les arachides, le maïs, le coton et le riz), la création de bovins et de l'exploitation du bois. L'industrie (en particulier le bois) a augmenté ces dernières années, alors que le commerce et les services sont concentrés dans les grandes villes et ont un dynamisme sans précédent.

Les bas-fonds et les plaines produisent chaque année de grandes quantités de riz et de légumes que les femmes éprouvent des difficultés à écouler, en raison de l'enclavement de la zone où il n'y a pas une bonne piste.

L'agriculture reste la principale activité économique du secteur. Mobilise plus de 75% de la population en très importantes surfaces cultivables, des sols et se prêtent à des cultures différentes.

Cette activité, qui est la principale source de subsistance de la population, est largement tributaire de la pluviométrie très fluctuante. L'importance du secteur agricole peut être expliquée par la disponibilité des terres dont l'accessibilité n'est pas une source de conflit, car les disponibilités sont relativement au-dessus des besoins.

Les principales spéculations sont enregistrées pour les cultures vivrières (riz, sorgho, mil et maïs) et des cultures de rente (arachide) et, en particulier, l'exportation (la culture des noix de l'anacardier) qui occupe une bonne partie du calendrier agricole.

Ces différents types de cultures sont réalisés par des matières agricoles rudimentaires composées essentiellement le coupe-coupe, le hue, la machette, le daba et le râteau et pour certains la charrue à traction animale. Ces instruments sont utilisés par les agriculteurs pour les travaux préliminaires tels que la compensation, le labour, le nettoyage.

Malgré la présence de beaucoup de bonnes terres de bas-fonds, la culture irriguée est pratiquement inexistante, mais certaines associations, en particulier les femmes, la pratique des cultures de contre-saison (maraîchage) dans les petits périmètres irrigués à la main avec l'appui des partenaires extérieurs. Au niveau de Bafata et Contuboel les associations des producteurs produisent le riz en contre saison dans un périmètre irrigué avec de système de pompage.

Agriculture, en dépit de son importance économique, il reste bloqué dans son développement par de multiples difficultés qui ont causé un faible revenu généralisée. Ces difficultés sont notamment:

- insuffisant et vétusté de machines agricoles (en particulier les charrues à traction animale) en raison d'un renouvellement faible,
- La faible fertilité des sols liée à une mauvaise utilisation des techniques culturales, faible utilisation des engrais organique, la destruction des couverts végétales par les feux de brousse et les coupes abusives des forêts à des fins diverses, laissant le sol nu soumis à l'érosion hydrique et éolienne,
- l'accès difficile aux semences de qualité qui suit l'échec d'une production locale de semences, et le faible revenu agricole ne permettent pas aux agriculteurs de libérer l'excès à la constitution de stock,
- les dommages causés par les prédateurs sont le résultat de la non- utilisation de pesticides,

Enfin, le manque des aménagements hydroagricoles des bas-fonds et des plaines.

- **Domaine de l'Elevage**

L'élevage est la deuxième activité économique importante réalisée dans les Province du l'Est C. Il est une source considérable de revenus. La vente de bétail permet de couvrir les dépenses majeures des familiales dans les périodes difficiles d'accès aux aliments causée par sécheresse ou dépenses sociaux et des soins. Le troupeau est très important et se compose de bovins, ovins, caprins, porcins et volailles en quantité considérable.

La volaille sont également élevés et permettre aux femmes réguler certains des leurs frais. Les données sur les volailles ne sont pas disponibles en raison du manque de statistiques fiables.

La création pratiquée dans les régions éloignées est le type extensif et occupe une place importante dans le plan socio- économique. Cette activité qui est associée à l'agriculture obéit principalement à une logique de prestige social, en particulier dans l'élevage du bétail. Le troupeau est vendu aux membres de la famille des besoins (baptêmes, mariages, funérailles) et les fêtes religieuses (Tabaski).

La volaille sont également élevés et permettre aux femmes régulières certains des faux frais. Les données sur les volailles ne sont pas disponibles en raison du manque de statistiques fiables.

La création pratiquée dans les régions éloignées est le type extensif et occupe une place importante dans le plan socio- économique. Cette activité qui est associée à l'agriculture obéit principalement à une logique de prestige social, en particulier dans l'élevage du bétail. Le troupeau est vendu aux membres de la famille pour régler des besoins (baptêmes, mariages, funérailles) et les fêtes religieuses (Tabaski). Dernièrement, il a été une évolution dans la création de bétail. Les éleveurs vendent des animaux pour couvrir le voyage de ses enfants à l'immigration ou à construire des maisons couvertes de zinc dans leurs villages et des villes sièges régionaux et à Bissau.

L'incendie de la forêt dans la de zones de création et le manque de connaissances des techniques améliorées de pâturage font que les créateurs subissent d'énormes difficultés pour l'alimentation du bétail, en particulier dans la saison sèche.

La santé des animaux est confrontée dans les régions par le manque de soins préventifs réguliers. Certaines maladies sont endémiques dans le pays. Il est des maladies parasitaires et la peste bovine. Cependant, les campagnes de vaccination sont organisées de façon sporadique par les services vétérinaires.

Les parcours existants sont très étroites, provoquent souvent des conflits entre agriculteurs et éleveur. Cela est dû à l'absence de création de corridors pour les zones de pâturage.

Dans toutes les contraintes identifiées ajouté au faible d'organisation des agriculteurs pour défendre leurs intérêts communs.

- **Domaine de la sylviculture**

En ce qui concerne la foresterie rurale, il est nécessaire de noter que peu ou rien est pris en compte au niveau de l'activité productive des populations.

Il existe une large biodiversité au niveau des forêts mais il faut noter toutefois que ce potentiel naturel est fortement exploité. Cette exploitation des ressources naturelles et la faiblesse de l'intervention de la population et de l'Etat, en particulier dans le reboisement et les activités de protection de régénération naturelle, il court le risque de causer des dommages irréversibles aux ressources. La pratique de la carbonisation et de l'agriculture de coupe et brûles sont très commune dans les régions.

L'état de très avancé de dégradation des ressources est également liée à l'abattage et l'élagage abusif des arbres de bois et de charbon.

Faible application en cas d'arrestation ne constitue pas un facteur de démotivation pour les entrepreneurs illégaux. A plus sévères amendes et sanctions constitueraient une étape importante pour réduire cette pratique.

Est aussi une contrainte de clé sur l'intensité et la fréquence des feux de brus qui lancent sérieusement dans les réserves fourragères et sont la principale cause de la destruction de la biodiversité.

Les autres causes sont l'ordre anthropique avec les actions combinées des peuples autochtones au moment des opérations de préparation du sol. Les agriculteurs et les éleveurs adoptent les pratiques agricoles et l'élevage traditionnel plutôt que les techniques modernes rentables qui améliorent et augmentent la production agricole et animale, sont également des exemples qui montrent que l'immobilité est un problème majeur et est une contrainte préjudiciable au développement.

CHAPITRE VI : DESCRIPTION DES IMPACTS GÉNÉRIQUES DU PROJET

L'évaluation des enjeux environnementaux et sociaux du projet, s'est réalisée grâce à une analyse croisée des caractéristiques environnementales et sociales des zones d'intervention du projet et des activités de référence à réaliser. Cette évaluation s'est effectuée selon une démarche participative qui a permis une large consultation des différents acteurs qui seront concernés par l'exécution du projet. En outre, l'évaluation des impacts environnementaux et sociaux a tenu compte des différentes phases de mise en œuvre des activités, à savoir: la préparation des sites, la construction des infrastructures et la mise en service et/ou la mise en valeur des infrastructures. Ainsi, la présente section traite des résultats de l'évaluation des impacts des activités prévues dans le cadre du projet.

6.1. Activités du projet sources d'impact/risques

Les principales activités du projet, sont entre autres :

- le renforcement des capacités des acteurs sur les changements climatiques et leurs effets sur la sécurité alimentaire ;
- la sensibilisation des communautés à la base sur les menaces liées aux changements climatiques et les mesures d'adaptation et de résilience relatives au secteur agricole ;
- la formation des producteurs aux pratiques agricoles susceptibles de préserver durablement le sol et les ressources en eau ;
- les travaux d'ouvrages d'aménagement :
 - transport des équipements ;
 - installation et repli de chantier ;
 - implantation ;
 - préparation et décapage de terrain ;
 - abatage des arbres ;
 - fouille pour ouvrage ;
 - remblai latéritique ;
 - digue de protection,
- Mise en valeur des périmètres :
 - Défrichage/Désherbage ;
 - Labour ;
 - Semis ;
 - Entretien ;
 - application des fertilisants (fumure organique ou engrais chimiques);
 - utilisation des pesticides ;
 - activités de reboisement ;
 - etc.

6.2. Composantes du milieu susceptibles d'être affectées

Les composantes du milieu (ou récepteurs d'impacts) susceptibles d'être affectées par le projet sont notamment : l'air, l'eau, le sol, la flore, la faune, les écosystèmes et le milieu humain.

En règle générale, lorsqu'on est en face de deux normes, c'est celle qui est la plus contraignante qui est appliquée. Dans le cadre de cette étude les principes environnementaux et sociaux du Fonds d'Adaptation seront appliqués étant donné qu'elles sont plus contraignantes que les normes de sauvegarde environnementale et sociale de la BOAD et que la BOAD constitue une agence d'implémentation du Fonds d'Adaptation.

6.3. Identification des impacts

L'identification des impacts est faite à partir de la matrice de Léopold adaptée et qui met en relation les activités sources d'impact prévues par phase et les principes environnementaux et sociaux du Fonds d'Adaptation. Le croisement des deux paramètres permet de dégager l'impact lié à l'activité sur la composante de l'environnement considérée dans les principes E&S correspondants du Fonds d'Adaptation.

En résumé, en tenant compte de l'analyse faite à partir du tableau ci-dessous, les impacts prévisibles

Tableau 5: Interactions entre activités sources d'impact par phase du projet suivant les principes du Fonds d'Adaptation

Phases	Activités et éléments sources d'impacts du projet	Principes du Fonds d'Adaptation														
		Conformité avec la loi	Accès et équité	Groupes vulnérables et marginalisés	Droits humains	Genre et autonomisation des femmes	Conditions de travail	Peuples autochtones	Réinstallation	Protection des habitats	Conservation de la diversité biologique	Changement climatique	Prévention de la pollution et gestion efficace des	Santé publique	Patrimoine culturel	Conservation des terres et des sols
Phase de préparation	Lancement du projet															
	Activités de renforcement de capacités techniques, organisationnelles et institutionnelles		x	x		x										
	Réalisation des APD approfondis	x														
	Appel d'offres et Acquisition des équipements			x												
Phase de construction	Mobilisation et amené d'engins sur les sites													x		
	Installation et repli de chantier	x			x		x			x	x					
	Implantation															
	Préparation et décapage de terrain															
	Abatage des arbres															
	Fouille pour ouvrage ;															
	Remblai latéritique ;															
	Géotextile pour filtre et toutes suggestions ;															
	Gabionnage pour seuils ou construction de digue															
	Enrochement de protection aval,															

Phase d'exploitation	Préparation des sols et labours																		
	Acquisition des semences améliorées									x	x								
	Semis						x									x			
	Exploitation de l'eau												x						
	Opérationnalisation des ouvrages						x										x	x	
	Entretien des ouvrages et cultures																		
	Acquisition et application des fertilisants (fumure organique ou engrais chimiques) ;		x	x	x	x	x				x	x		x	x			x	
	Utilisation des pesticides		x	x	x	x	x				x	x	x	x	x				x
	Rejet des emballages de pesticides													x			x		x
	Récolte																		
Activité génératrice de revenu		x	x			x												x	
Phase de fin de projet	Abandon des équipements																		
	Démantèlement							x										x	x

6.4. Description des impacts

6.4.1. Impacts positifs du projet

Les impacts positifs de la mise en œuvre du présent sous-projet sont importants et diversifiés pour le groupement et la communauté nigérienne. Ils sont d'ordre environnemental et socio-économique.

Au plan environnemental, il s'agit de : la gestion durable des ressources en eau, la réduction de la consommation des combustibles fossiles, la réduction des émissions de GES, l'amélioration de la qualité des sols, l'amélioration du paysage.

Au plan socio-économiques, il s'agit de : la création d'emplois, un meilleur accès à l'énergie pour l'irrigation, la réduction de la facture énergétique, l'amélioration de la production et des revenus des agriculteurs, l'allègement des tâches des femmes et des enfants et gain de temps, l'amélioration des revenus des femmes et leur épanouissement, l'amélioration des conditions de vie des producteurs, l'amélioration de la nutrition infantile et de la sécurité alimentaire, l'accroissement des capacités des acteurs pour le développement et la mise en œuvre des approches résilientes aux effets néfastes des changements climatiques, etc.

6.4.1.1. Impacts environnementaux positifs

- *Gestion durable des ressources en eau*

L'appui technique et organisationnel qui sera apporté par le projet dans la gestion des périmètres sera bénéfique pour la gestion durable des ressources en eau dans les zones du projet. Sur certains sites, les modes d'irrigation économes en eau tel que le californien seront diffusés.

- *Amélioration ou maintien de la qualité des sols*

La mise en place des activités de conservation des sols, des actions d'agroforesterie et de meilleures techniques culturales seront promues à travers un mécanisme d'incitation dans le cadre du projet. Ces actions sont de nature à limiter l'ensablement des sites, de retarder ou de modifier les dynamiques d'érosion hydrique et d'améliorer la qualité des sols. Ce qui sera bénéfique pour la production. Des sensibilisations sont également prévues en vue d'inciter aux communautés à la pratique des par feu et la lutte contre des feux de brousses. Ces actions sont de nature à protéger les sols et les ressources forestières.

- *Protection des ressources en eau et des sols à travers l'amélioration des capacités des producteurs dans la gestion des pesticides et engrais chimiques*

Un excédent de dosage, une mauvaise conservation, une mauvaise connaissance de la rémanence des pesticides ou encore un déversement accidentel dans la nature peut entraîner des infiltrations de la substance active dans les sols, les eaux de surfaces comme souterraines et/ou une forte concentration dans l'air. Les différentes formations et les appuis conseils qui seront conduits en faveur des producteurs dans le cadre du grand projet et en particulier dans le cadre de ce sous-projet permettront assurément de renforcer les capacités et les pratiques des producteurs sur la parcelle en matière de gestion efficace et efficiente des pesticides. Ceci permettra de préserver l'environnement notamment les ressources en eau et des sols.

6.4.1.2. Impacts socio-économiques positifs

Les impacts positifs socio-économiques liés à la mise en œuvre du projet sont :

- *Accroissement des capacités des acteurs pour le développement et la mise en œuvre des approches résilientes aux effets néfastes des changements climatiques*

Le projet est en soi un projet d'agriculture intelligente qui vise à réduire la vulnérabilité des systèmes agricoles, contre les effets néfastes des changements climatiques dans les zones d'intervention. Les activités de renforcement des capacités des agents gouvernementaux et des producteurs, programmées dans le cadre du projet, permettront d'accroître les capacités de tous ces acteurs dans l'initiation et dans la mise en œuvre des approches résilientes aux changements climatiques.

Ces actions de renforcement des capacités seront également bénéfiques pour les femmes et les jeunes, en leur offrant une occasion privilégiée de participer à une activité lucrative au même titre que les hommes et d'améliorer leur niveau d'organisation et leur implication dans la prise de décision.

- *Création d'emplois*

Les activités de réalisation d'implantation des ouvrages hydrauliques, de préparation et labours du sol et bien d'autres activités sont de nature à promouvoir des emplois directs, constitués essentiellement de la main d'œuvre locale. Des emplois indirects seront créés le long des circuits d'approvisionnement d'intrants, de commercialisation des produits agricoles.

- *Contribution à la sécurité alimentaire*

Le projet va contribuer à la réduction des risques liés à l'insécurité alimentaire. En effet, l'aménagement et/ou l'extension des périmètres irrigués de type familial ou de groupement va constituer une source d'approvisionnement constante en produits maraîchers grâce à une production agricole diversifiée et soutenue. En outre, les actions de renforcement des capacités prévues à l'intention des exploitants agricoles sur les nouvelles techniques culturales et à l'usage des intrants agricoles (engrais et pesticides) amélioreront la production, tant sur le plan qualitatif que sur le plan quantitatif. Ainsi, l'amélioration des performances des systèmes de production et la diversification des activités contribueront à une amélioration des revenus et des conditions d'alimentation des populations.

Par ailleurs, l'intervention présente un certain nombre d'impacts indirects qui pourront se révéler positifs vis-à-vis du milieu :

- amélioration des moyens d'accès pour les services et organismes en charge de l'appui conseil dans le domaine de la production agricole ;
- accroissement du nombre d'emplois et augmentation simultanée du revenu moyen par habitant, ce qui aura pour conséquence de contribuer à la lutte contre la pauvreté.

De plus, l'extension des superficies emblavées et l'accroissement de la productivité des terres par la rationalisation des techniques culturales, vont engendrer un gain substantiel de la production agricole, et par conséquent contribuer à renforcer la sécurité alimentaire en tant qu'une nécessité pressante pour la lutte contre la pauvreté. En effet, selon les populations consultées, l'exploitation des sites maraîchers à des fins alimentaires (autoconsommation) et commerciales, va contribuer à intensifier et à diversifier les cultures maraîchères au niveau des sites qui seront retenus. Ces populations affirment que les productions des cultures irriguées, sont principalement destinées à l'autoconsommation et à la vente. Ce qui leur permet de lutter contre l'insécurité alimentaire (autoconsommation) d'une part, et d'autre part, d'augmenter leurs revenus grâce à la vente des produits maraîchers.

Les activités de maraichages pratiquées par des femmes dans le cadre du projet, vont permettre d'améliorer leurs conditions socio-économiques, et par conséquent contribuer à la réduction de leur vulnérabilité.

- *Réduction du phénomène d'exode et renforcement du tissu familial*

La migration et l'exode rural représentent une caractéristique de la dynamique des populations dans le Nord Est de la Guinée Bissau. Cette mobilité pratiquée en période de soudure, contribue à la satisfaction des besoins fondamentaux des ménages ruraux. Ainsi, le développement de l'irrigation tel qu'il est visé par

le projet, va permettre de freiner la mobilité (migration et exode rural), à restaurer le système économique dans les zones bénéficiaires et apporter une amélioration qualitative substantielle des niveaux de vie, et par conséquent placer l'activité agricole comme un moyen de lutte contre la pauvreté, de maîtrise des flux migratoires et de préservation du tissu familial.

- *Amélioration de la vie associative*

Le contexte actuel, caractérisé par le désengagement progressif des États, la mise en œuvre du processus de décentralisation, la responsabilisation de la société civile et le renforcement du rôle du secteur privé, offre à l'ensemble du monde rural des perspectives et des opportunités nouvelles de participer à la définition des politiques, stratégies et projets et à leur mise en œuvre. C'est pourquoi, les activités des organisations paysannes sont très diversifiées. Elles concernent le développement de la production agro-pastorale, le maraîchage, l'arboriculture fruitière, la pêche, la commercialisation et l'artisanat, l'exploitation et la transformation des produits forestiers, les actions de gestion des ressources naturelles et de protection de l'environnement. Ainsi, les interventions du projet vont créer une pleine implication des organisations paysannes, et permettre ainsi le développement de la vie associative qui est l'un des éléments clés de la durabilité de l'ensemble des actions prévues dans le cadre du projet.

- *Contribution à l'organisation sociale de la communauté*

Les impacts du projet sur l'organisation socioculturelle, sont entre autres :

- le renforcement des groupements ou organisations paysannes locales ;
- l'appui socio-organisationnel que les sites aménagés vont induire ;
- la mise en place des coopératives et des comités de gestion ;
- le renforcement des capacités des exploitants.

- *Amélioration de la production et des revenus des agriculteurs*

La mise en place des infrastructures de collectes des eaux permettra de faciliter l'irrigation. Ceci contribuera à l'accroissement de la production et à l'amélioration des revenus des producteurs. Les économies réalisées par les paysans pourront être affectées à d'autres activités économiques ou à la formation scolaire des enfants.

Le financement du projet engendra donc des retombées économiques au profit des zones bénéficiaires grâce à l'augmentation des revenus en améliorant, du coup, la qualité de vie des populations bénéficiaires. En effet, les activités qui seront financées par le projet vont créer des emplois temporaires avec le recrutement de la main d'œuvre locale pendant la période des travaux

d'aménagement et/ou d'extension des sites irrigués. Avec la création d'emplois temporaires et l'achat des matériaux, le projet va générer des retombées économiques dans les régions d'interventions.

En outre, l'accroissement des revenus des populations bénéficiaires, induira sans une nette amélioration de l'effectif du cheptel dans les zones du projet, grâce à l'achat des ruminants (bovins, ovins et caprins) et de la volaille. Enfin, les revenus générés par la vente des produits maraîchers et l'embouche, vont certainement permettre aux populations bénéficiaires (femmes) d'entreprendre d'autres activités génératrices des revenus (AGR), et par conséquent contribuer à lutter contre la pauvreté pour les ménages bénéficiaires.

- *Amélioration des revenus des femmes et leur épanouissement*

Le projet dans sa réalisation a prévu des activités de soutien aux femmes à la transformation des produits agricoles, au conditionnement et à la commercialisation. Cette activité permettra aux groupements de femmes bénéficiaires d'améliorer leurs revenus et de mieux s'épanouir au plan social.

- *Amélioration de la santé nutritionnelle des populations*

La diversification de la production et l'amélioration des rendements vont contribuer à l'amélioration de la nutrition chez ménages bénéficiaires. L'augmentation du pouvoir d'achat des populations avec l'exploitation des périmètres irrigués, va permettre la disponibilité des moyens thérapeutiques et de prévention contre certaines maladies (achat de médicaments, de moustiquaires, ...).

6.4.1.3. Autres impacts positifs

- Réduction de l'érosion du sol
- Recharge des nappes phréatiques
- Augmentation de la réserve d'eau dans le sol
- Augmentation de la végétation autour des sites
- Amélioration de l'accès à l'eau potable pour la population et pour le bétail
- Soulagement des charges du ménage (la corvée d'eau)
- Diversification de la situation alimentaire
- Organisation améliorée de la population locale
- Access amélioré aux services éducatifs, santé
- Réduction de la pauvreté

En dépit de ces impacts positifs ci-dessus présentés, les activités du projet engendreront des impacts négatifs et des risques potentiels sur l'environnement biophysique et humain.

6.4.2. Description et évaluation des impacts négatifs et risques

6.4.2.1. Description des impacts et risques liés aux activités du projet

D'après le tableau d'identification des impacts et risques du projet, les principes environnementaux et sociaux déclenchés, en termes d'impact négatifs, sont : (i) la conformité avec la Loi, (ii) Equité et accès, (iii) Groupes marginalisés et vulnérables (iv) les droits humains, (v) Genre et autonomisation de la femme, (vi) les droits fondamentaux du travail, (vii) la protection des habitats naturels, (viii) la conservation de la diversité biologique, (ix) la prévention de la pollution et l'utilisation efficiente des ressources, (x) la santé publique, (xi) le patrimoine physique et culturel , (xii) Changement climatique, (xiii) la terre et la conservation des sols.

Les impacts négatifs et les risques associés à ces principes environnementaux et sociaux du Fonds d'Adaptation sont:

- la faible intégration des enjeux environnementaux et sociaux relatives aux principes du Fonds d'Adaptation dans la préparation des EIES des sous-projets ;
- la faible capacité des producteurs pour la mise en œuvre des mesures environnementales et sociales, conformément à la législation nationale et aux principes environnementaux du Fonds d'Adaptation;
- le risque du travail des enfants en dehors des limites fixées par la loi;
- le risque lié à la santé et la sécurité des travailleurs durant la mise en œuvre des activités sur les sites;
- la destruction de la végétation et l'habitat faunique pour l'implantation des ouvrages d'irrigation;
- le risque de dégradation de la qualité de l'eau et du sol en cas de non maîtrise de l'application des engrais et pesticides;
- la disparition de certains éléments de la biodiversité par l'utilisation incontrôlée de pesticides;
- la contamination des sols et des eaux par des produits chimiques;
- le risque d'intoxication par l'inhalation ou par la consommation d'eau ou d'aliments contaminés par des pesticides;
- le risque de développement de maladies d'origine hydrique du fait de la rétention de l'eau pour l'irrigation;
- le risque de destruction du patrimoine physique durant les découvertes fortuites.

Tableau : Description des impacts négatifs

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
Conformité avec la Loi	Faible intégration des enjeux environnementaux et sociaux relatives aux principes du Fonds d'Adaptation dans la préparation des EIES des sous-projets	Compte tenu de la pratique actuelle dans la formulation des EIES dans le pays conformément à la réglementation nationale et aux donateurs tels que la Banque mondiale et la BOAD, il est possible que l'évaluation des impacts et des risques ne tienne pas suffisamment compte des principes environnementaux et sociaux du Fonds d'adaptation dans la formulation des EIES des sous-projets.
	Faible capacité des producteurs pour la mise en œuvre des mesures environnementales et sociales, conformément à la législation nationale et aux principes du FA	Les études d'impact environnemental et social ou les Notices d'impact environnemental et social réalisées pour le compte des sous-projets seront assorties de Plans de gestion environnementale et sociale suivant les principes environnementaux et sociaux du FA. Les mesures prescrites seront mises en œuvre sur les parcelles par les producteurs. Cependant, il existe un risque lié à la faible capacité des producteurs pour mettre en œuvre les mesures environnementales et sociales proposées, conformément à la législation nationale et aux principes du Fonds d'Adaptation (FA).
Accès et Equité	Risque d'accroissement des inégalités entre les femmes, les	Les producteurs sont dans leur majorité les pauvres qui ne sont pas souvent intégrés dans le processus décisionnel. Ils sont des hommes, des femmes et des jeunes.

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
	hommes, les enfants et surtout les groupes vulnérables	Il y a donc un risque de manque d'accès aux ressources du projet par ces producteurs au niveau du renforcement des capacités techniques et organisationnelles, l'accès aux équipements de techniques d'irrigation modernes, l'accès aux intrants agricoles de qualité et des installations de développement des activités génératrices de revenue.
	Risque du non plein participation de certains groupes dans la préparation et la mise en œuvre du sous-projet	Il y a un risque que tous les membres des groupements bénéficiaires ne soient pas impliqués dans la préparation et la mise en œuvre des sous-projets
	Risque de non maîtrise et de traitement inéquitable des cas d'empoisonnement par les services de santé	Le développement des cultures nécessitera l'utilisation des pesticides qui peut constituer des sources d'inhalation et d'intoxication pendant les opérations de traitement des cultures. Ces cas d'intoxication devront être traités par les centres de santé des zones d'intervention du projet comme prévu dans le cadre du grand projet. Il existe, donc, un risque que les cas d'intoxication ne soit pas traité équitablement par ce centre de santé
Groupes marginalisés et vulnérables	Risque de non implication des groupes marginalisés et vulnérables dans l'octroi des ressources du projet	Dans le cadre du projet, il est proposé de renforcer le système d'irrigation afin de diversifier la production agricole et réduire la vulnérabilité des agriculteurs aux conséquences néfastes du changement climatique. Avec cette approche, le projet assurera une meilleure adaptation au changement climatique qui compromet la production et la productivité. Les activités contribueront à créer des actifs à long terme

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
		<p>pour les bénéficiaires. Les activités du projet aideront aussi à créer des moyens de subsistance et des revenus pour les agriculteurs.</p> <p>Il peut exister le risque que ces groupes vulnérables et marginalisés ne sont pas impliqués dans le renforcement des capacités techniques et organisationnelles prévues sous la composante 1, n'accèdent pas aux équipements techniques modernes d'irrigation prévus sous la composante 2, ou ne bénéficient pas des intrants agricoles de qualité et aux activités génératrices de revenu prévues sous la composante 3 du projet.</p>
Droits fondamentaux du travail	<p>Risque liés à la santé et la sécurité des travailleurs</p>	<p>Pendant les travaux de réalisation ouvrages et pendant leur exploitation, les travailleurs sont exposés au risque d'accident de travail qui peut aller de simples blessures à la mort. Il en est de même pendant les opérations de préparation des sols, de labours, d'entretien, etc.</p> <p>L'approvisionnement en intrants agricoles présente également des risques d'accident de la circulation pendant le transport. Certains producteurs peuvent être exposés au risque d'intoxication s'ils ne sont pas formés dans l'utilisation des pesticides et s'ils n'ont pas des équipements de protection individuelle.</p>
	<p>Risque du travail des enfants en dehors des limites fixées par la Loi</p>	<p>Dans les zones rurales, les enfants aident les parents dans les activités champêtres. Dans le cadre du projet, il n'est pas exclu que les enfants soient employés à des tâches pénibles</p>

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
Egalité de sexes et autonomisation des femmes	Prise en compte insuffisante du genre dans la mise en œuvre du projet	Les femmes et les jeunes ont été largement consultés au stade de l'identification et de conception des projets. Il est important pour être sûr qu'ils seront effectivement impliqués dans la phase de mise en œuvre du projet qui va être menée par l'unité de gestion de projet qui n'est pas encore en place.
Protection des habitats naturels	Destruction de la végétation et l'habitat faunique	Les travaux d'aménagement peuvent occasionner la destruction de la végétation et des habitats fauniques sur le site
	Risque de dégradation de la qualité de l'eau et du sol	<p>La mise à nu des sols et l'utilisation des engrais et pesticides peuvent contribuer à la dégradation des sols</p> <p>L'utilisation des pesticides et des engrais chimiques peuvent constituer des sources de dégradation de la qualité de l'eau et des sols</p>
Conservation of Biological Diversity	Risques de disparition de certaines espèces de la biodiversité par l'utilisation incontrôlée de pesticides	<p>Les travaux d'aménagement et mise en place des ouvrages peuvent provoquer la destruction d'espèces végétales, contribuant ainsi à accentuer l'érosion de la biodiversité.</p> <p>L'application incontrôlée de pesticides se traduira par des impacts négatifs sur les espèces végétales et animales.</p>

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
Prévention de la pollution et gestion efficiente des ressources	Contamination des sols et des eaux par des polluants	Le développement du projet va nécessiter l'usage des pesticides dans le cadre de la lutte contre les parasites. L'utilisation non rationnelle des pesticides et engrais chimique sur la parcelle peut entraîner la pollution de l'eau et du sol
	Risque de restriction de la disponibilité de l'eau en aval des périmètres aménagés	La construction des infrastructures hydrauliques pourrait limiter la disponibilité de l'eau pour la population en aval des périmètres aménagés.
Santé publique	Risque d'intoxication par inhalation ou par la consommation d'eau ou d'aliments contaminés par des pesticides ou des engrais	La mise en œuvre du projet comporte des risques pour la santé humaine à travers l'utilisation de pesticides et autres produits chimiques sur les parcelles. L'exposition aux pesticides peut être directe (contact lors de l'application, en passant au-dessus d'un site traité) ou secondaire ou indirecte (pour l'eau, nourriture...) et est susceptible de concerner dans ce cas toute la population.
	Développement de maladies liées à l'eau	La présence continue de l'eau sur les périmètres irrigués pourrait occasionner le développement de maladies d'origine hydrique (paludisme, fièvre typhoïde, dysenterie amibienne, etc.).
Patrimoine physique et culturel	Risque de destruction du patrimoine physique durant les découvertes fortuites	Bien que l'identification des sites tient compte de la protection du patrimoine culturel physique, les découvertes fortuites ne sont pas exclues durant la mise en œuvre du

Principes E&S du FA déclenchés	Impacts / Risques identifiés	Description de l'impact ou le risque
		projet. Le risque de destruction du patrimoine physique et culturel durant les découvertes fortuites est présent
Conservation des terres et des sols	Dégradation de la qualité du sol et de la terre	<p>Bien que le sous-projet comporte des activités de reboisement et cherche à promouvoir l'agroforesterie, certaines activités peuvent avoir des effets négatifs sur la qualité du sol notamment l'usage des pesticides et engrais chimiques. L'utilisation non rationnelle des engrais et pesticides conduira à polluer et à dégrader les sols.</p> <p>Les résidus chimiques pourraient se former avec d'autres composés naturels dans le sol et dégrader le pH du sol complexe et provoquer l'acidification.</p>

6.4.2.2. Evaluation des impacts liés aux activités du projet

Le tableau suivant présent les résultats d'évaluation des impacts génériques et risques du projet

Principes E&S du FA	Impacts / Risques	Intensité	Étendue	Durée	Importance absolue
<i>Conformité avec la Loi</i>	Faible intégration des enjeux environnementaux et sociaux dans la mise en œuvre du projet (préparation des PGES des sites)	Moyenne	Locale	Moyenne	Moyenne
	Faible capacité des parties prenantes à gérer les questions environnementales et sociales conformément à la législation nationale et les principes E&S du Fonds d' Adaptation	Moyenne	Locale	Moyenne	Moyenne
<i>Accès et équité</i>	Risque de restriction de l'accès aux ressources/activités du projet par certains segments de la population	Faible	régionale	Moyenne	Moyenne
<i>Groupes vulnérables et Marginalisés</i>	Risque de discrimination des groupes vulnérable	Faible	régionale	Courte	Moyenne
<i>Droits humains</i>	Risques de non maîtrise et de traitement inéquitable des cas d'empoisonnement par les services de santé	Moyenne	Locale	Moyenne	Moyenne
	Risque du travail des enfants en dehors des limites fixées par la Loi	Faible	régionale	Courte	Moyenne

	Risque de pollution du sol	Moyenne	Locale	Moyenne	Moyenne

CHAPITRE VII. DESCRIPTION DES MESURES

Les mesures ci-après sont préconisées aux différentes phases des activités prévues par le projet, dans le but d'atténuer les impacts négatifs et de renforcer les impacts positifs.

Tableau 6: Impacts/risques environnementaux et sociaux et les mesures d'atténuation

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
Conformité avec la Loi	Faible intégration des enjeux environnementaux et sociaux dans la préparation des en	Conduire des études d'impact environnemental et social des sous-projets suivant les 15 principes environnementaux et sociaux du Fonds d'Adaptation. Intégrer les résultats des EIES dans le Plan cadre de gestion environnementale et sociale pour en faire un Plan de gestion environnementale et sociale du projet
	Faible capacité des parties prenantes à gérer les questions environnementales et sociales conformément à la législation nationale et les principes E&S du Fonds d'Adaptation	Afin d'assurer une intégration transparente de l'environnement dans la mise en œuvre du projet, il est nécessaire de renforcer les capacités techniques des services d'État qui seront impliqués dans la mise en œuvre du projet. Il s'agit de services déconcentrés responsables de: (i) l'Agriculture (directions régionales/départementales de l'agriculture) ; (ii) environnement (directions régionales et départementales de l'environnement) ; (iii) protection des végétaux (directions régionales, départementales et les antennes de protection des végétaux et postes de contrôle phytosanitaires). Ces services appuieront les producteurs à mettre en œuvre des mesures environnementales et sociales. Des campagnes d'information, d'éducation et de communication (IEC) seront organisées pour les producteurs afin de leur permettre de gérer les exigences environnementales et sociales suivant les principes E&S du Fonds d'Adaptation.
	Faible suivi des indicateurs de suivi	Pour atténuer ce risque, il est essentiel d'établir un système de monitoring des indicateurs performants E & S pour les sous-projets.

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
Accès et équité	Risque de restriction de l'accès aux ressources/activités du projet par certains segments de la population	<p>Les activités du projet ciblent les groupes vulnérables dépendants de l'agriculture dans les différentes communes choisies. Dans ce contexte, tous les groupes d'agriculteurs qui soumettent une demande de financement de sous-projet ont donc une égalité de chances de bénéficier les activités d'adaptation proposées par le projet.</p> <p>Toutefois, afin d'assurer un accès équitable aux ressources du projet, les mesures suivantes devraient être mises en œuvre :</p> <ul style="list-style-type: none"> - Mise en place de critères transparents pour sélectionner les sous-projets et les bénéficiaires ; - Intégration équitable des femmes, des personnes âgées et des jeunes dans les sessions de renforcement des capacités des producteurs;
Groupes vulnérables et Marginalisés	Risque de discrimination des groupes vulnérable	La sélection définitive des sites devra tenir compte des groupes vulnérables. Elle devra faire participer les femmes dans la mise en œuvre du projet.
Droits humains	Risques de non maîtrise et de traitement inéquitable des cas d'empoisonnement par les services de santé	Pour éviter ce risque, il est nécessaire de renforcer les capacités d'intervention des centres de santé des communes d'intervention du projet pour le traitement efficace et équitable des cas d'empoisonnement.
	Risque du travail des enfants en dehors des limites fixées par la Loi	Pour prévenir l'emploi des enfants, les producteurs devront être sensibilisés sur les inconvénients liés à l'emploi des enfants dans des tâches pénibles et à risque, notamment sur leur état de santé et sur leur développement.
Egalité de sexe et autonomisation de la femme	Prise en compte insuffisante de l'intégration du genre dans la mise	Afin d'assurer une bonne prise en compte du genre dans la sélection des bénéficiaires, les critères transparents doivent être préparés en conséquence. Ainsi, le projet devrait envisager l'intégration du genre dans la

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
	en œuvre du projet	sélection des bénéficiaires des projets retenus. Ainsi, le nombre de femmes et jeunes gens qui bénéficient d'un soutien financier pour le développement de zones irriguées avec des techniques modernes et le nombre de femmes, jeunes et personnes âgées qui bénéficient d'un soutien financier pour le développement d'activités génératrices de revenu activités augmenteront.
	Contribution insuffisante des projets à l'autonomisation des femmes	Afin d'assurer une participation effective des femmes dans le sens de leur autonomisation, le projet doit promouvoir la participation des femmes dans le développement des activités du projet. Pour ce faire, les femmes seront impliquées dans le processus décisionnel, pour leur permettre de bénéficier des ressources du projet et d'augmenter leurs revenus grâce au projet.
<i>Droits fondamentaux du travail</i>	Risque de préjudice à la santé et la sécurité des travailleurs	Afin d'assurer les meilleures conditions de travail, les mesures suivantes sont proposées: - se conformer à la législation en vigueur notamment le code du travail ; - fournir tous les équipements de protection pour les travailleurs (chaussures, gants et masques nasaux) ; - renforcer la capacité des agriculteurs à l'utilisation de pesticides - Sensibiliser les travailleurs sur les risques d'accident du travail
	Risque du travail des enfants en dehors des limites fixées par la Loi	Même si les bénéficiaires sont responsables de l'exploitation de leur périmètre, le projet assurera l'élimination des pires conditions de travail et en particulier le travail forcé des enfants conformément à la disposition du Code de travail. Ainsi, les producteurs devront être sensibilisés sur les inconvénients liés à l'emploi des enfants dans des tâches pénibles et à risque,

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
	<p>Risque liés à la santé et la sécurité des travailleurs</p>	<p>notamment sur leur état de santé et sur leur développement.</p> <p>Afin d'assurer les meilleures conditions de travail, les mesures suivantes sont proposées:</p> <ul style="list-style-type: none"> - Sensibiliser les producteurs sur les risques d'accident du travail et les dispositions sécuritaires à prendre; - Renforcer les capacités des producteurs à l'utilisation de pesticides; - acquérir les équipements de protection individuelle (chaussures, gants, masques nasaux, etc.) et veiller à leur port effectif; - désigner et former au sein de chaque groupement bénéficiaire un ou deux responsables hygiène-santé-environnement.
<i>Protection d'habitats naturels</i>	<p>Destruction de la végétation et l'habitat faunique</p>	<p>Pour atténuer cet impact, il est nécessaire de:</p> <ul style="list-style-type: none"> - promouvoir le système de l'agroforesterie et de la plantation d'arbres avec une valeur nutritionnelle ou médicinale; - renforcer les capacités des producteurs sur l'utilisation de pesticides
	<p>Intensification de la dégradation des sols</p>	<p>L'atténuation de l'impact lié à la dégradation des sols cultivés pourra se faire à travers :</p> <ul style="list-style-type: none"> - l'appui conseil ou renforcement des capacités du groupement dans l'application des engrais chimiques; - l'incitation à l'usage des amendements organiques ou tout autre engrais verts; - la rotation de cultures sur les parcelles.
<i>Conservation de la diversité biologique</i>	<p>Disparition de certaines espèces de la biodiversité par l'utilisation incontrôlée de pesticides</p>	<p>L'utilisation de pesticides et d'engrais chimiques entraînera la destruction de certains espèces non cibles de la biodiversité. Pour réduire ces impacts, des mesures de bonnes pratiques en gestion de la lutte antiparasitaire et des pesticides ont été élaborées. Un manuel sera disponible pour les producteurs pour une meilleure utilisation de ces produits. En outre, les activités de reboisement et l'intégration de</p>

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
		<p>l'agroforesterie avec la plantation d'espèces de valeur nutritionnelle ou médicinales aidera à conserver les sols et restaurer la fertilité des sols à moyen terme. Ces actions contribueront également à limiter l'envasement des sites, retarder ou changer la dynamique de l'érosion hydrique.</p>
<p><i>Prévention de la pollution et gestion efficace des ressources</i></p>	<p>Contamination des sols et des eaux par des polluants</p>	<p>Pour réduire la pollution de l'eau par les activités du projet, les mesures suivantes doivent être mises en œuvre:</p> <ul style="list-style-type: none"> - Mise en place d'une gestion rationnelle des polluants conformément aux normes de la FAO et l'OMS. Ceci est possible grâce à: (i) la réduction des engrais agrochimiques utilisés pour limiter la contamination des eaux souterraines ; (ii) la promotion d'amendements organiques (engrais organique) afin de limiter l'utilisation d'engrais chimiques. - Renforcement des capacités des producteurs pour le système de gestion des produits chimiques (engrais et pesticides). L'utilisation rationnelle de ces produits contribuera à limiter la pollution de l'eau et du sol ; - Appuyer à l'acquisition des matériels d'analyses de l'eau et du sol - Conduire périodiquement des analyses du sol et de l'eau afin de suivre qualité <p>Il est essentiel de prendre périodiquement des échantillons d'eau pour analyse en laboratoire afin de déterminer la qualité physico-chimique de l'eau souterraine dans les zones couvertes par le projet. Il est donc nécessaire de mener des actions de suivi réguliers et de contrôler les paramètres affectant la qualité de l'eau, comme le pH, la</p>

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
		température, la conductivité et certains éléments chimiques.
<i>Santé publique</i>	<p>Risque d'intoxication par inhalation ou par la consommation d'eau ou d'aliments contaminés par des pesticides ou des engrais</p>	<p>Afin de protéger la santé des consommateurs et maraîchers, des mesures concrètes doivent être prises. Ce sont, entre autres: (i) renforcement de capacité des producteurs pour gérer les pesticides conformément à l'utilisation des normes de pesticides ; (ii) la bonne gestion des pesticides par les agriculteurs ; (iii) formation périodique et sensibilisation des agriculteurs sur l'utilisation optimale des produits agrochimiques (engrais azotés), sur les effets nocifs des traitements phytosanitaires et des brigadiers phytosanitaires sur le port des équipements de protection (masques nasaux) lors de l'application des pesticides ; (iv) informer et sensibiliser les agriculteurs sur les maladies liées à la présence d'eau et de l'accumulation des éléments traces dans les plantes et les animaux sauvages ; (iv) renforcement de capacité des centres de santé à gérer des dossiers toxicologiques. De bonnes pratiques en matière de pesticides devraient être proposées pour une meilleure gestion.</p>
	<p>Risque de développer de maladies liées à l'eau</p>	<p>Pour réduire les risques de de développement ou d'aggravation des maladies d'origine hydrique, il faudra:</p> <ul style="list-style-type: none"> - informer et sensibiliser les agriculteurs sur les maladies liées à la présence d'eau (paludisme, fièvre typhoïde, dysenterie amibienne, etc.); <p>inclure la zone du projet dans le programme d'intervention du système de surveillance épidémiologique.</p>
Patrimoine culturel et physique	Risque de destruction du patrimoine culturel et physique durant les découvertes fortuites	En cas de découvertes fortuites, les groupements de producteurs devront saisir les autorités administratives locales, les chefs coutumiers et l'UGP pour des mesures à prendre. Il est nécessaire d'établir un système de reprise des découvertes fortuites de

Principes E&S du FA	Impacts / Risques	Mesures d'atténuation
		patrimoine physique et culturel. Ce système devrait être géré par la direction en charge du patrimoine culturel en Guinée Bissau
<i>Conservation des terres et des sols</i>	Dégradation de la qualité du sol et de la terre	<p>Le projet devrait développer des techniques d'agriculture durables préservant le sol. À cet effet, des fiches de bonnes pratiques doivent être développées et mises à la disposition des producteurs. Une évaluation devrait être réalisée afin de mesurer le niveau d'adoption de meilleures pratiques agricoles par les producteurs.</p> <p>Elle favorisera des amendements organiques (engrais organique) afin de limiter l'utilisation d'engrais chimiques et de renforcer la capacité des producteurs à l'usage de produits chimiques. Il est essentiel de mettre à la disposition des producteurs la fiche de bonnes pratiques sur l'utilisation d'engrais.</p> <p>Le système agroforesterie et le reboisement prévu devraient être encouragés pour aider à la conservation des sols et restaurer la fertilité des sols à moyen terme. Ces actions contribueront également à limiter l'envasement des sites, retarder ou changer la dynamique de l'érosion hydrique.</p>
	Risque de pollution de l'eau et du sol	<p>Pour atténuer le risque de dégradation de la qualité de l'eau et du sol, le projet :</p> <ul style="list-style-type: none"> - renforcer la capacité des producteurs pour un usage rationnel des intrants (engrais et pesticides) - Conduire périodiquement des analyses du sol pour suivre l'évolution de la qualité du sol des sites

CHAPITRE VIII : PLAN CADRE DE GESTION ENVIRONNEMENTALE ET SOCIALE

La présente section présente les axes majeurs qui composent le plan cadre de gestion environnementale et sociale (PCGES) du projet, tenant compte des exigences des textes régissant l'environnement en Guinée Bissau, les principes environnementaux et sociaux du Fonds d'Adaptation ainsi que les normes des bonnes pratiques en matière de gestion de l'environnement.

L'objectif du PCGES est de :

- définir les directives à l'attention des différents acteurs sur l'opportunité et la nature des évaluations environnementales à entreprendre ;
- servir de guide aux différentes parties prenantes du projet pour l'identification des impacts détaillés des différentes activités des sous-projets ;
- Servir de base pour la préparation des plans de gestion environnementale et sociale pour les sous-projets;
- permettre la préparation d'un plan de suivi-évaluation des mesures d'atténuation ;
- renforcer les capacités des structures impliquées dans le processus d'identification, d'évaluation et de suivi des impacts environnementaux et sociaux ;
- estimer les coûts y relatifs ainsi que la chronologie.

Le tableau suivant présente le Plan cadre de gestion environnementale et sociale qui comprend les mesures d'atténuation des impacts et risques et les mesures de bonification des impacts positifs.

Pour être effectif, le PCGES doit être traduit en Plan de gestion environnementale et sociale (PGES) du projet intégrant les résultats des études d'impact environnemental et social (EIES) des sous-projets. Ainsi, lorsque les sites seront définitivement retenus et les études d'impact environnemental et social (EIES) des sous-projets conduites, les résultats des EIES seront intégrés dans le présent PCGES pour en faire un Plan de gestion environnementale et sociale (PGES) du projet qui sera appliqué à tous les sous-projets suivant les spécificités des sites.

Les mesures de gestion environnementale et sociale sont intégrées dans les composantes du projet et leurs coûts dans le budget du projet.

8.1. Plan cadre de gestion environnementale et sociale à la phase de préparation

Principes E&S du Fonds d'Adaptation	Impact positifs	Impact négatifs/risques	Mesures d'atténuation et de bonification	Indicateurs de suivi	Responsable de mise en œuvre	Période	Responsable du suivi	Institution d'appui technique	Coût (X USD)
Conformité avec la Loi		Faible intégration des enjeux environnementaux et sociaux dans la préparation des EIES des sous-projets	Conduire des études d'impact environnemental et social des sous-projets suivant les 15 principes environnementaux et sociaux du Fonds d'Adaptation	Nombre de sites dont les EIES ont été conduites suivant les 15 principes environnementaux et sociaux du Fonds d'Adaptation	UGP	Durant la formulation des sous-projets	AAAC	Direction Générale de l'Environnement (DGE)	Inclus dans le budget du projet (activité 2.1.1 et 2.1.2)
Accès et Équité		Risque de non accès des ressources du projet par des une couche de la population	Mettre en place de critères transparents pour retenir définitivement les sites à aménagés et les bénéficiaires	Niveau d'application des critères équitables pour la sélection des participants aux sessions de formation organisées	UGP	Lors de la sélection définitive des sites	AAAC	DGE	PM
				Efficacité du système de communication du projet	UGP				
			Tenir compte des femmes, des personnes âgées et des jeunes dans la sélection définitive des groupements bénéficiaires	Pourcentage de femmes, les personnes âgées et les jeunes gens qui ont bénéficié de la formation	UGP				
Groupes vulnérables et marginalisés		Risque de non profitabilité des groupes vulnérables et marginalisés aux effets du projet	Prendre en compte les groupes vulnérables et marginalisés dans la mise en œuvre	Pourcentage de jeunes et de femmes bénéficiaires du projet	UGP	Semi-annuel	AAAC	DGE	PM

Principes E&S du Fonds d'Adaptation	Impact positifs	Impact négatifs/risques	Mesures d'atténuation et de bonification	Indicateurs de suivi	Responsable de mise en œuvre	Période	Responsable du suivi	Institution d'appui technique	Coût (X USD)
Egalité de sexe et autonomisation de la femme		Risque de non intégration du genre (hommes, femmes, jeunes, personnes âgées) dans la mise en œuvre du projet	Prendre en compte le genre dans l'établissement des critères de sélection des bénéficiaires	Nombre de femmes et jeunes qui bénéficient du soutien technique et financier pour le développement des superficies irriguées	UGP	Semiannually	AAAC	DGE	PM
Changement climatique	Accroissement des capacités des acteurs pour le développement et la mise en œuvre des approches résilientes au Changement climatique		Veiller à la participation effective et efficiente des femmes et des jeunes aux différents ateliers de renforcement des capacités à travers des activités	Nombre de femmes et de jeunes capables d'assimiler les meilleures approches et pratiques enseignées et de transmettre les connaissances acquises aux autres membres du groupement	UGP	Avant le démarrage effectif des activités	AAAC	DGE	PM

8.2. Plan cadre de gestion environnementale et sociale à la phase de construction

Principes E&S du Fonds d'Adaptation	Impact positifs	Impact négatifs/risques	Mesures d'atténuation et de bonification	Indicateurs de suivi	Responsable de mise en œuvre	Période	Responsable du suivi	Institution d'appui technique	Coût (X 1000 USD)
Conformité avec la Loi		Risque de faible mise en œuvre des clauses environnementales par les entreprises	Intégrer les clauses environnementales des DAO dans les contrats d'exécutions des travaux	Niveau de mise en œuvre des mesures environnementales par les entreprises	UGP	Pendant les travaux de construction	AAAC	DGE	5 000

Le coût de la mise en œuvre du Plan cadre de gestion environnementale et sociale est évalué à cent quarante-quatre mille (144 000) USD.

8.5. Préparation du plan de gestion environnementale et sociale définitif du projet

Le Plan cadre de gestion environnementale et sociale, ci-dessus, sera renforcé par les résultats des études d'impact environnemental et social des sous-projets pour en faire un plan de gestion environnementale et sociale du projet qui sera appliqué à tous les sous-projets suivant les exigences du PGES de chaque sous-projet.

Les due-diligences pour la préparation des EIES des sous-projets et de leur mise en œuvre sont décrites dans le chapitre suivant.

**CHAPITRE IX : APPROCHE DE GESTION ENVIRONNEMENTALE
ET SOCIALE DES SOUS-PROJETS**

L'approche ci-dessous décrite sera appliquée dans la préparation et la mise en œuvre des sous-projets.

9.1 Due diligence environnementale et sociale des sous-projets

Pour permettre l'intégration des dimensions environnementales et sociales dans la conception et la mise en œuvre des sous-projets, il est essentiel de proposer une procédure permettant d'évaluer les impacts environnementaux et sociaux des sous-projets, de déterminer les mesures environnementales et sociales et de définir les acteurs qui seront responsables de leur mise en œuvre et suivi. En effet, la procédure sera l'approche qui permettra de déterminer le niveau et les modalités de prise en compte des impacts environnementaux et sociaux dans le cycle des sous-projets. Les études à mener seront guidées par les principes environnementaux et sociaux du Fonds d'adaptation.

Lorsque le choix des sites des sous-projets sera finalisé, les études d'impact environnemental et social (EIES) des sous-projets seront effectuées conformément à la Politique environnementale et sociale du Fonds d'adaptation. L'identification et l'évaluation des impacts et des risques seront effectuées sur la base des 15 principes environnementaux et sociaux du Fonds d'adaptation.

Étape 1 : Formulation des termes de référence des EIES des sous-projets et autorisation de l'AAAC pour la réalisation de ces EIES

Pour les sous-projets sélectionnés qui nécessitent la formulation d'une EIES, les termes de référence (TDR) seront élaborés par l'UGP et soumis à la BOAD avec une courte liste de consultants pour préparer l'EIES. La BOAD enverra à l'UGP, la non-objection sur les TDR et la short-liste pour le recrutement du Consultant. Une fois que la BOAD a émis la non-objection, l'avis de projet conformément aux procédures nationales EIES) annexées aux TDR et les consultants sélectionnés par le PMU, sera envoyé par le PMU à l'AAAC. L'AAAC émettra l'autorisation de procéder à l'évaluation de l'impact environnemental et social, conformément aux procédures nationales de l'EIES.

L'autorisation reçue de l'AAAC par l'UGP permettra au consultant de préparer le rapport d'EIES du sous-projet concerné.

Étape 2 : Préparation des études d'impact environnemental et social des sous-projets

Le(s) consultant(s) recruté(s) par l'UGP conduiront les études d'impact environnemental et social (EIES) des sous-projets. Chaque EIES sera assortie d'un Plan de gestion environnementale et sociale (PGES) conformément à la politique environnementale et sociale du Fonds d'adaptation. Les mesures d'atténuation, de compensation et de prévention seront déterminées en fonction du niveau des impacts et des risques identifiés sur le terrain en tenant compte de l'ensemble des 15 principes environnementaux et sociaux du Fonds d'adaptation. Les PGES des sous-projets prendront en compte les mesures de gestion intégrées des pestes et pesticides.

Les ESIA des sous-projets et leurs PGES serviront à mettre à jour l'actuel Plan cadre de gestion environnementale et sociale (PCGES) et à définir définitivement le Plan de gestion environnementale et sociale (PGES) du projet applicable à tous les sous-projets selon les exigences du PGES de chacun de sous-projet. L'un des Consultants qui ont réalisé les EIES des sous-projets sera sélectionné pour mettre à jour le PGES du projet sous la supervision de l'UGP et le contrôle de la BOAD.

Étape 3 : Examen et approbation des rapports d'EIES des sous-projets

Lorsque les rapports d'EIES des sous-projets sont préparés, ils seront divulgués au niveau de l'UGP, de l'AAAC et de la BOAD pour permettre aux parties prenantes de faire leurs commentaires sur le contenu de l'EIES. Les commentaires seront pris en compte dans le rapport par le consultant. Le rapport corrigé par le consultant sera soumis à l'UGP.

Sous la supervision de l'AAAC, les rapports d'EIES des sous-projets produits par le Consultant seront soumis à un Comité d'approbation du rapport d'EIES conformément aux procédures nationales en matière d'EIES. Les membres du Comité d'approbation du rapport de l'EIES seront nommés par décret du ministre chargé de l'environnement conformément aux procédures nationales de l'EIES. Le ministre de l'Environnement délivrera son autorisation sur le rapport

d'approbation du Comité et sur la recommandation de l'AAAC conformément aux procédures nationales de l'EIES.

Pour gagner du temps et de l'argent, l'UGP veillera à ce que l'examen et l'approbation des EIES de tous les sous-projets par le comité d'approbation de rapport d'EIES puissent avoir lieu ensemble si possible.

Une fois que l'EIES reçoit l'autorisation du ministre chargé de l'environnement, l'UGP enregistrera le sous-projet dans son portefeuille de financement. **Étape 4 :**

Mise en œuvre des mesures environnementales et sociales

Les bénéficiaires des sous-projets sont responsables de la mise en œuvre des mesures environnementales et sociales au cours de toutes les phases du sous-projet sous la supervision de l'UGP. Ils seront soutenu, si nécessaire, par un consultant et les animateurs du site au cas où ils n'auraient pas d'expertise interne à cet effet et que la formation prévue par l'UGP dans le cadre du projet sera insuffisante pour les aider.

Étape 6 : Surveillance et suivi environnemental et social

La surveillance et le suivi environnemental et social se feront comme décrit dans le chapitre « surveillance et suivi environnemental et social du projet ».

9.2 Approche spécifique de gestion intégrée des pestes et pesticides dans le cadre de la mise en œuvre du projet

Bien que la zone du projet ne soit pas reconnue comme une zone d'attaque de parasites, la mise en œuvre du projet demande qu'on prévoie des techniques préventives et curatives de lutte contre les ennemis de cultures. Ainsi un Plan de gestion intégrée des pestes et pesticides (PGIPP) a été préparé à partir des informations recueillies au niveau de la zone d'intervention du projet par le biais des consultations des bénéficiaires, des services techniques de la protection des végétaux, de l'agriculture, de l'environnement, de l'élevage, de la santé publique, etc. Les informations de terrain ont été complétées par des recherches et analyses documentaires traitant la gestion des pestes et pesticides.

La lutte intégrée contre les parasites (IPM) est une approche holistique des techniques de lutte antiparasitaire, visant à maintenir les applications des pesticides et d'autres interventions dans des limites économiquement justifiées tout en minimisant les risques (réels ou potentiels) pour la santé humaine ou l'environnement. La lutte contre les nuisibles naturels joue un rôle important dans l'IPM, et comprend des mesures directes et indirectes (voir le tableau ci-dessous). Le projet actuel sur l'agriculture intelligente pour le climat vise à réduire de manière significative l'application des pesticides chimiques directement, où de nombreuses activités - utilisation des cultures adaptées aux conditions locales, dépendance aux attentes de rendement appropriées, utilisation de variétés résistantes, densification optimale des cultivars, etc. - Chevauchement avec protection indirecte des plantes

L'option pour la promotion de la lutte intégrée contre les ravageurs et les pesticides dans le cadre du projet est faite pour éviter ou réduire considérablement l'utilisation de pesticides chimiques. En cas d'attaque parasitaire, les méthodes les moins dangereuses seront préférées. Les pesticides chimiques seront utilisés dans des cas extrêmes où des méthodes moins dangereuses s'avéreront inefficaces. Dans ce cas, le choix de l'utilisation de pesticides chimiques sera effectué conformément aux recommandations du plan intégré de lutte antiparasitaire et pesticide. Étant donné que la Guinée-Bissau n'a pas une expérience soutenue dans la lutte intégrée contre les ravageurs et les pesticides, il est très important de tenir compte des expériences et des enseignements tirés de la FAO dans la gestion intégrée des ravageurs et des pesticides dans les pays subsahariens de l'Afrique. C'est pourquoi, les membres du comité national de gestion des pesticides et des pesticides (CNGP), les agents DPV, le PMU, les représentants des ONG chargés de la supervision des bénéficiaires sur les périmètres seront formés à la gestion intégrée des parasites et des pesticides Dans la zone du projet par un expert très expérimenté dans la gestion intégrée des pesticides et des pesticides de la FAO dans les pays subsahariens d'Afrique. Cet expert sera recruté par l'UGP sous la supervision de l'Entité d'exécution

À la fin des séances de formation, une boîte d'outils intégrés de lutte contre les ravageurs et les pesticides sera mise à la disposition des bénéficiaires, du DPV, de l'UGP, du CNGP et de la Direction régionale de l'agriculture pour des actions intégrées de lutte intégrée contre les ravageurs et les pesticides. Cette boîte d'outils préparée par l'Expert ayant des expériences de la FAO dans le cadre de la gestion intégrée des pestes et pesticides, indiquera les actions appropriées à entreprendre suivant les différents ravageurs. La boîte à outils indiquera également les pesticides de classe U et III de l'OMS que les bénéficiaires peuvent utiliser si les actions de lutte alternative s'avèrent inefficaces pour résoudre le problème.

L'approche suivante garantira une gestion coordonnée et durable des parasites et des pesticides dans le cadre du projet

Étape 1: Diffusion des alternatives de lutte antiparasitaire
Les alternatives aux pesticides en tant que contrôle agronomique, culturel, mécanique et biologique seront diffusées pour une meilleure utilisation par les producteurs. Les semences résistantes seront également promues. Ces actions seront intégrées au début des sites ou au développement des cultures afin de prévenir l'attaque par des ravageurs. La boîte d'outils intégrés de lutte contre les ravageurs et les pesticides élaborée à la suite de la formation par l'expert de la FAO sera mise à la disposition des bénéficiaires

Pour la gestion intégrée des pestes et des pesticides et d'autres activités durables dans le cadre du projet, le projet collaborera étroitement avec les bureaux régionaux (CILSS à Ouagadougou (Burkina Faso, AGRHYMET à Niamey (Niger), EMPRES-FAO (Prévention des principales poussées de parasites en Afrique de l'Ouest et du Nord-Ouest) impliqués dans le développement durable de l'agriculture

Aucune modélisation spécifique des préjugés, exemple : Via le niveau de blessure économique et les seuils d'action, l'épidémiologie et les modèles de prévision, est prévu pour ce projet. Si disponible, cela peut être entrepris en collaboration avec des projets tiers identifiés par le Consultant recruté pour renforcer les capacités en matière de lutte intégrée contre les ravageurs et les pesticides

Étape 2: Lorsqu'une attaque de cultures par des parasites est observée sur un site, les bénéficiaires, sous le contrôle de l'animateur du site et du coordinateur régional du projet, feront recours aux alternatives appropriées adoptées dans les outils de gestion intégrée des pestes préparés avec l'appui de l'Expert en gestion intégrée des pestes pour lesquelles les bénéficiaires, les animateurs de sites et les coordinateurs régionaux du projet ont déjà reçu une formation. Ces alternatives seront appliquées dans un esprit de protection de l'environnement et de santé humaine. Le coordinateur régional du projet informera l'UGP des mesures adéquates prises sur le périmètre par les bénéficiaires pour mettre fin à l'attaque des ravageurs.

Étape 3: Dans les cas extrêmes, où les actions alternatives se révèlent inefficaces, la direction régionale de la DPV, qui a également reçu une formation de l'expert en gestion intégrée des pestes, conseillera l'UGP sur la nécessité d'achats limités de pesticides de classe III ou U de l'OMS. L'utilisation des pesticides de classe III et U par les bénéficiaires se fera avec l'appui de l'UGP sous le contrôle de la DPV. Le Comité national de gestion des pesticides (CNGP)¹¹ sera informé par le DPV et l'UGP informera la BOAD du processus suivi.

Les alternatives possibles pour la lutte chimique antiparasitaire qui peuvent être utilisées dans le cadre du projet sont présentées dans le tableau ci-dessous:

¹¹ Pour pallier aux problèmes liés à l'utilisation non contrôlée des pesticides et réduire les risques liés à l'utilisation de pesticides de mauvaise qualité il est mis en place un Comité National de Gestion des Pesticides (CNGP) en Guinée Bissau conformément à l'article 11 du Décret – Loi n° 7/2000 du 24 août 2000. Ce comité est formé des membres venant des structures tels que l'environnement, la santé, l'agriculture, les organisations d'agriculteurs, la douane. Le CNGP assure, entre autres : (i) la mise en œuvre et le suivi du respect des procédures et normes de contrôle de qualité des pesticides ; (ii) le contrôle post homologation des pesticides ; (iii) le contrôle de conformité des pesticides; (iv) le contrôle de la distribution et de l'utilisation des pesticides ; (v) le contrôle des Limites Maximales de Résidus (LMR) des produits d'importation destinés à la consommation locale ; (vi) le contrôle des professionnels de la filière des pesticides; (vii) la tenue du registre des opérateurs de la filière ; (viii) la tenue et l'actualisation des pesticides homologués ; (ix) la dénonciation des pesticides non homologués entrés dans le pays ; (x) le suivi en matière de toxicovigilance; (xi) le suivi des essais de pré-vulgarisation ; (x) le suivi de la mise en œuvre des conventions internationales relatives aux pesticides. Plusieurs structures interviennent au sein de ce comité (l'environnement, la santé, les organisations d'agriculteurs, la douane).

Protection indirecte des plantes	Suivi et prévision	Protection directe des plantes
<p>Utilisation optimale des ressources naturelles:</p> <ul style="list-style-type: none"> - Utiliser une culture adaptée aux conditions locales - S'appuyer sur les attentes de rendement appropriées - Utilisation de variétés résistantes - Gestion des mauvaises herbes avec une intensité de concurrence suffisante - Des mélanges adéquats de variétés et de cultures - Calendrier optimal de la période de semis - Formation sur les ravageurs et les pesticides appropriés, en particulier les options biologiques, et l'importance des zones de compensation écologique <p>Utilisation des pratiques agricoles sans impact négatif sur les agro-écosystèmes:</p> <ul style="list-style-type: none"> - Absence d'apport excédentaire de nutriments (en particulier N); - Densité optimale de la culture et du feuillage pour faciliter la ventilation - Faible intensité du travail du sol / méthodes de culture et de production protégeant la fertilité des sols - Gestion des mauvaises herbes pour le contrôle de l'érosion 	<ul style="list-style-type: none"> • Le suivi et la prévision de l'incidence des ravageurs seront effectués conformément au plan d'IPM du projet. • Aucune modélisation spécifique des préjugés, p. Via le niveau de blessure économique et les seuils d'action, l'épidémiologie et les modèles de prévision, est prévu pour ce projet. Si disponible, cela peut être entrepris en collaboration avec des projets tiers identifiés par le Consultant recruté pour renforcer les capacités en matière de lutte intégrée contre les ravageurs et les pesticides 	<p>Utilisation de méthodes sélectives de lutte antiparasitaire:</p> <ul style="list-style-type: none"> • Partout et chaque fois que cela est adéquat, dépend de la lutte biologique, des bio pesticides, etc. <p>Méthodes chimiques de lutte antiparasitaire, uniquement lorsque d'autres options échouent ou seront très probables:</p> <ul style="list-style-type: none"> • Préférence pour les pesticides les plus spécifiques et sélectifs (classe III et U de l'OMS) • Préférence pour les pesticides les moins nocifs et les moins toxiques (classe III et U de l'OMS)

<ul style="list-style-type: none">- Conservation et protection de la biodiversité pour améliorer la biodiversité, réduisant ainsi l'incidence des ravageurs- Lorsqu'une protection et une augmentation adéquates des antagonistes biologiques bénéfiques.		
--	--	--

Un document complet de Plan de gestion intégrée des pestes et pesticides est élaboré séparément du CGES.

CHAPITRE X : GESTION DES GRIEFS

Le projet proposé utilisera le mécanisme actuel de règlement des griefs de la BOAD pour permettre aux personnes touchées de soulever des inquiétudes selon lesquelles le projet proposé ne respecte pas ses politiques ou engagements sociaux et environnementaux.

La BOAD a mis en place un mécanisme de règlement des griefs par le biais de et sa politique de règlement des griefs et son manuel de procédures qui est un mécanisme indépendant par lequel les personnes qui ont subi un préjudice résultant d'un projet financé ou mis en œuvre par la BOAD peuvent déposer une plainte auprès de la Banque. Le mécanisme de règlement des griefs, qui est mis à la disposition des parties prenantes, fait partie de la durabilité environnementale, sociale et économique pour traiter les cas de conformité et de règlement des griefs découlant des projets mis en œuvre par la BOAD. Ce manuel définit le mécanisme de règlement des plaintes dans la mise en œuvre de tout projet financé ou mis en œuvre par la BOAD. Il vise à établir un dialogue efficace entre les personnes concernées par les projets qu'ils financent et toutes les parties intéressées, pour résoudre le problème ou les problèmes à l'origine d'une demande, sans chercher à attribuer la responsabilité ou la faute à aucune de ces parties.

Au niveau de la BOAD, le mécanisme de règlement des griefs est coordonné et géré par la Division de Conformité et de Réglementation (DCR) avec le soutien de la Mission résidente de la BOAD dans ses États membres. Les communautés touchées et les autres parties prenantes qui seront affectées par le projet peuvent soumettre des plaintes à la BOAD, l'entité d'implémentation de la présente proposition, par courrier, courriel électronique, fax ou téléphone. Au niveau de la zone d'intervention du projet, l'unité de gestion du projet est le point de contact pour toutes les plaintes liées aux projets des parties prenantes. L'unité de gestion du projet devrait répondre rapidement et de façon appropriée à une plainte avec l'appui de la mission résidente de la BOAD et un rapport est fait à la DCR qui est basée au siège social de la BOAD. Lorsque la plainte ne peut être gérée au niveau du projet, le coordonnateur du projet dirigera les plaignants à remplir un formulaire de plainte pour soumission à la DCR de la BOAD. Le coordonnateur du projet devrait exhorter les plaignants à fournir des informations complètes, de sorte que la BOAD puisse évaluer et traiter correctement la plainte.

Il incombera à l'UGP, sous le contrôle de la BOAD, de veiller à ce que toutes les parties prenantes concernées soient suffisamment informées du mécanisme de règlement des griefs. Ce mécanisme sera mis à disposition des Gouvernorats régionaux et des administrateurs des provinces (secteurs). Des copies du manuel du mécanisme de règlement des griefs seront disponibles au niveau des villages. Il sera également posté sur le site Web du projet et le site Web de l'entité d'exécution (BOAD). Les procédures sur la façon de présenter la plainte sont disponibles sur le site Internet de la BOAD (www.boad.org) ou directement

à <https://www.boad.org/en/policies-procedures-guidelines/> (sous le point « DOCUMENTS DE CONFORMITÉ ET GRIEVANCE »).

Si la DCR constate qu'une plainte est admissible, la DCR compose une équipe d'experts interne et / ou externe pour enquêter sur le cas et proposer des options à considérer pour le plaignant.

Le tableau ci-dessous présente des informations sommaires sur l'examen de la conformité et la réponse aux griefs.

	Examen de conformité	Réponse des griefs
Plaignant	Toute personne ou groupe de personnes susceptibles d'être affectées par des activités soutenues par BOAD. Bien que les plaintes anonymes ne soient pas acceptées, les demandes de confidentialité seront respectées.	
Canal	<p>Les plaignants peuvent contacter la Division de Conformité et de Réglementation (DCR) de la BOAD par courrier, par courriel électronique, par fax ou par téléphone.</p> <p>L'adresse de la DCR:</p> <p>Banque Ouest Africaine de Développement 62 av. de la Libération BP 1172 Lomé, Togo Tél: +228 22 21 59 06 Fax: +228 22 21 52 67 E-Mail: boadsiege@boad.org Web: www.boad.org</p> <p>Les plaignants devraient fournir tous les détails pour permettre à la Banque d'évaluer l'admissibilité.</p> <p>Les procédures sur la façon de présenter la plainte sont disponibles sur le site Internet de la BOAD (www.boad.org) ou directement à https://www.boad.org/en/policies-procedures-guidelines/ (sous le point « DOCUMENTS DE CONFORMITÉ ET GRIEVANCE »)</p>

**CHAPITRE XI : SURVEILLANCE ET SUIVI
ENVIRONNEMENTAL ET SOCIAL**

11.1 Arrangements institutionnels pour la surveillance et le suivi environnemental

- La surveillance environnementale et sociale du projet

La surveillance environnementale et sociale est de la responsabilité des promoteurs des sous-projets sous la supervision de l'UGP avec le soutien des institutions techniques nationales et locales concernées. Ces différentes institutions sont indiquées dans le plan cadre de gestion environnementale et sociale.

La supervision se fait au niveau de tous les sous-projets conformément au PGES du projet. Un rapport mensuel sera préparé par le PMU sur la gestion du PGES et envoyé à la BOAD.

- Le suivi environnemental et social du projet

Le suivi environnemental du projet sera assuré par l'Autorité Compétente d'Evaluation Environnementale (AAAC). Cette mission se fera en collaboration avec la Direction de l'environnement et du développement durable, de la Direction de la protection des végétaux, de la Direction de l'agriculture et d'autres structures publiques et privées.

Au niveau régional et local, le dispositif de suivi s'appuiera sur les Directions et services régionaux (environnement, agriculture, protection des végétaux, élevage, santé, protection civile, ONG et Associations, etc.), l'Institut National de recherche agricole.

Pour ce qui concerne le cas spécifique de la gestion intégrée des pestes et pesticides, le suivi du Plan de gestion intégrée des pestes et pesticides (PGIPP) incombera en premier lieu à la Direction de la protection des végétaux (DPV) en collaboration avec d'autres structures notamment le Comité nationale de gestion des pesticides, la Direction générale de l'Agriculture, la Direction générale de la santé publiques, etc..

La BOAD, l'entité d'implémentation, évaluera la mise en œuvre des mesures au moyen des rapports périodiques soumis par l'UGP et ses missions de vérification sur le terrain. Le rapport annuel de l'entité d'implémentation comportera une rubrique sur la mise en œuvre du CGES avec une sous-rubrique sur la gestion intégrée des pestes et pesticides dans le cadre de l'exécution du projet. Outre les évaluations annuelles de la gestion des pestes et des pesticides qui permettront une amélioration continue de la mise en œuvre du PGIPP, une évaluation à mi-parcours sera menée à la fin de la deuxième année de mise en œuvre et une autre à la fin du projet.

11.2 Programme de surveillance environnementale

La surveillance environnementale et sociale a pour objectif premier de contrôler la bonne exécution des activités et travaux pendant la durée du projet, et ce, au regard du respect des mesures environnementales et sociales qui sont proposées, des lois et règlements régissant les évaluations environnementales en Guinée Bissau, les principes directeurs du Fonds d'Adaptation et des politiques environnementale de la BOAD. Le programme de surveillance doit contenir :

- la liste des éléments ou paramètres nécessitant une surveillance environnementale ;
- l'ensemble des mesures et moyens envisagés pour protéger l'environnement ;
- les acteurs de mise en œuvre ;
- les engagements des maitres d'ouvrage ou maitres d'œuvre quant au dépôt des rapports de surveillance (nombre, fréquence, contenu).

Dans le cadre du projet, la surveillance environnementale sera assurée par l'AAAC en collaboration avec les agences d'exécution et leurs démembrements. Pour permettre aux agences de mener à bien le programme de surveillance, leur capacité dans le domaine sera renforcée.

11.3 Programme de suivi environnemental

Malgré la connaissance de certains phénomènes environnementaux et sociaux liés aux impacts génériques des activités du projet, il n'en demeure pas moins qu'il existe toujours un certain degré d'incertitude dans la précision d'autres impacts, notamment en ce qui concerne les impacts diffus et les impacts résiduels. Pour cette raison, il s'avère nécessaire d'élaborer un programme de suivi environnemental. Ce dernier doit permettre de vérifier la justesse de l'évaluation de certains impacts, d'évaluer l'efficacité des mesures d'atténuation mises en œuvre et permettre de faire des propositions des mesures éventuelles au besoin. Le programme de suivi environnemental présentera les indicateurs à utiliser pour assurer le suivi des mesures d'atténuation et de bonification.

Par ailleurs, le suivi environnemental et social permettra de suivre l'évolution de l'état de l'environnement, notamment les éléments sensibles, à partir d'indicateurs pertinents sur les composantes environnementales établis sur une base consensuelle par les différentes parties prenantes à son exécution. Les indicateurs de suivi de même que certains paramètres devront être précisés et affinés après la réalisation des études environnementales détaillées.

Canevas du programme de suivi environnemental du projet

- Suivi en phase de réalisation des infrastructures : Lors des travaux prévus dans le projet notamment, la réalisation des forages, l'aménagement de nouveaux périmètres, la réhabilitation ou le renforcement des infrastructures des périmètres existants, les règlements en vigueur et en particulier ceux concernant l'environnement devront être respectés. La réalisation des ouvrages de mobilisation d'eau d'irrigation, devront suivre la procédure de sélection et faire l'objet d'un suivi de proximité pour éviter les pollutions et nuisances et/ou perturbations liées aux activités.

- Suivi en phase de réalisation des actions d'appui à la production : La conduite des activités (i) d'approvisionnement et d'utilisation des intrants agricoles adéquats (semences et plants améliorées, fertilisants, pesticides, etc.) et (ii) de promotion des bonnes pratiques agricoles, doivent se faire conformément aux règlements en vigueur et en particulier ceux concernant l'environnement et le social. Ces activités doivent faire l'objet d'un suivi pour éviter les pollutions des eaux et de l'air, et les dégradations des sols, de la flore et de la faune.

Le suivi portera également sur les composantes telles que : l'état des ressources en eau; la fertilité chimique des sols, le mode d'utilisation des sols, l'hygiène et la santé (maladies hydriques, intoxication, les pollutions, les nuisances, etc.).

- Suivi et contrôle de la gestion intégrée des pestes et pesticides : la surveillance est soutenue par la collecte et l'analyse des données afin de vérifier si la mise en œuvre des activités se déroule comme prévu et de procéder à des ajustements immédiats si nécessaire. Il s'agit donc d'une activité d'évaluation à court terme permettant d'entreprendre une action en temps réel. La fréquence de la surveillance dépend du type d'information requise, mais elle sera continue tout au long de la mise en œuvre du projet. La surveillance globale sera assurée par les structures mises en place pour la mise en œuvre du projet. Il sera organisé des visites périodiques de terrain pour vérifier le niveau de respect des mesures et recommandations formulées. Pour ce faire, des indicateurs de suivi ont été établis par rapport aux mesures ci-dessus proposées dans le plan de mise en œuvre du PGIPP. Outre les évaluations annuelles de la gestion des pestes et des pesticides qui permettront une amélioration continue de la mise en œuvre du PGIPP, une évaluation à mi-parcours sera conduite à la fin de la deuxième année de mise en œuvre et une autre à la fin du projet.

11.4 Indicateurs essentiels de suivi

Les indicateurs sont des paramètres dont l'utilisation fournit des informations quantitatives ou qualitatives sur les impacts et les bénéfices environnementaux et sociaux du projet. Les indicateurs servent, d'une part, à la description, avec une exactitude vérifiable, de l'impact généré directement ou indirectement par les activités des composantes du projet, et, d'autre part, à la mise en exergue de l'importance de l'impact. Ils fournissent une description sommaire des états et des contraintes et permettent d'observer le progrès réalisé ou la dégradation subie dans le temps ou par rapport à des cibles. Ils révèlent des tendances passées et servent, dans une certaine mesure, d'instruments de prévision. En tant que tel, ils constituent une composante essentielle dans l'EIES du projet pour permettre d'évaluer l'efficacité des activités du projet, notamment l'installation des infrastructures agricoles ainsi que leur exploitation et entretien subséquents.

Les indicateurs de suivi aideront dans la mise en application des mesures d'atténuation, le suivi et l'évaluation de l'ensemble du projet en vue d'évaluer l'efficacité des activités.

Pour d'évaluer l'efficacité des activités du projet, les indicateurs environnementaux et sociaux de suivi ci-après sont proposés :

- Indicateurs d'ordre stratégique à suivre en phase de préparation :
 - Niveau d'intégration des principes environnementaux et sociaux du Fonds d'adaptation dans les différentes actions du projet;
 - Nombre d'acteurs formés pour la prise en compte des principes environnementaux et sociaux du Fonds d'adaptation dans le cadre du projet;
 - Existence d'un manuel de bonnes pratiques agricoles ;
 - Proportion de mise en œuvre des mesures contenues dans le PGES ;

Ces indicateurs seront régulièrement suivis au cours de la mise en place et l'avancement des actions, et seront incorporés dans le dispositif de suivi du projet.

Les différents indicateurs ci-dessous sont proposés pour être suivi lors de la mise en œuvre du projet:

i. Suivi en phase de réalisation des infrastructures

- Effectivité des clauses environnementales et sociales dans les dossiers d'exécution (DAO) ;
- Efficience des systèmes d'élimination des déchets issus des travaux de chantier ;
- Nombre d'accidents causés par les travaux ;
- Nombre d'hectare reboisé ;
- Nombre d'emplois créés localement (main d'œuvre locale non qualifiée utilisée pour les travaux) ;
- Niveau d'implication des collectivités et acteurs locaux dans le suivi des travaux ;
- Niveau de consensus (approbation) sur le choix des sites de constructions et d'aménagement ;
- Qualité des infrastructures réalisées ;
- Fonctionnalité des infrastructures réalisées ;
- Taux d'accès aux infrastructures.

Ces indicateurs seront suivis par les structures en charge des infrastructures rurales et les Bureaux de Contrôle chargés d'assister l'UGP.

ii. Suivi en phase de réalisation des actions d'appui à la production

- Utilisation rationnelle et écologiques des intrants agricoles (semences et plants améliorées, fertilisants, pesticides, géniteurs, alevins, provendes);
- Nombre de séances de sensibilisation organisées pour les producteurs agricoles sur l'utilisation optimale des intrants agricoles ;

- Utilisation rationnelle et écologiques des matériels agricoles ;
 - Niveau d'application des mesures d'atténuation environnementales et sociales dans les pratiques agricole ;
 - Niveau de respects des mesures d'hygiène, de santé et de sécurité ;
 - Existence de manuel de bonnes pratiques agricoles ;
 - Nombre de séances de formation organisées pour les agents de vulgarisation ;
 - Effectivité du suivi environnemental et social et du reporting des activités de vulgarisation.
- Indicateurs à suivre par les institutions étatiques en charges des questions environnementales et sociales :

L'AAAC en collaboration avec d'autres services techniques assurent le suivi externe de la mise en œuvre du CGES. Le suivi des mesures environnementales et sociales proposé constitue une partie intégrante du système de suivi et évaluation du projet.

CONCLUSION

Le Projet est en cohérence avec la vision 2035 de la Guinée Bissau et avec des politiques, stratégies de développement du secteur agricole et de lutte contre l'insécurité alimentaire et la pauvreté. Il constitue une réponse à l'adaptation des populations rurales vulnérables aux effets néfastes des changements climatiques dans le domaine de l'agriculture. Il trouve sa justification dans les considérations ci-après : i) contribution à la sécurité alimentaire, ii) contribution à la réduction de la pauvreté, iii) contribution à la maîtrise et à la gestion rationnelle des ressources en eau, et iv) lutte contre les effets néfastes des changements climatiques. L'objectif global du projet est de contribuer à la résilience des populations face au changement climatique à travers une agriculture intelligente. Le projet tel qu'il est conçu, peut engendrer des dommages environnementaux et sociaux potentiels qui seront très tôt pris en compte dans le processus de mise en œuvre afin d'éviter des effets irréversibles qui pourraient compromettre l'atteinte des objectifs du projet.

La présente étude a mis en évidence les impacts positifs et négatifs potentiels qui peuvent survenir durant la mise en œuvre du projet. Des mesures génériques ont été proposées et ont fait l'objet d'un Plan cadre de gestion environnementale et sociale afin de guider la préparation des Plans de gestion environnementale et sociale (PGES) pour chaque site retenu.

Ces plans devront contenir des actions réalistes et adoptées afin d'inscrire l'ensemble du projet dans un dynamique de développement durable. Les indicateurs de suivi devront être suivi par des structures compétentes afin d'évaluer l'efficacité des mesures proposées et de proposer, au besoin, des mesures correctives.

Le coût de la mise en œuvre du Plan cadre de gestion environnementale et sociale est évalué à cent quarante mille (140 000) USD.

I. Introduction

La Guinée-Bissau est située en Afrique occidentale, c'est un petit pays de 36.125 km² et une population approximativement de 1.700.000 habitants. Elle est comprise par une partie continentale, coupée par des nombreux fleuves et marigots d'eau douce et l'eau salée et une partie insulaires avec plus de 80 îles.

Le climat divise le pays en trois zones agro-écologiques. La zone d'étude (nord-est) est caractérisée par un climat soudanais avec deux saisons bien distinctes : une saison sèche comprise entre novembre et mai et une saison des pluies de juin à octobre. Les précipitations, dans la zone d'identification des sites, varient entre 1 100 et 1 400 mm/an. Le taux d'évapotranspiration s'élève à 2 507 mm et la température moyenne annuelle est de 27,4°C. Actuellement, quasi 80% des précipitations annuelles tombent pendant les mois de juillet, août et septembre.

Dans le cadre de la préparation du projet, une équipe composée par Monsieur Apá da Costa, Ingénieurs Hydraulicien Rural et Mangla Nantchia, Agronome, s'est déplacée du 3 au 9 Novembre 2016 aux différentes Secteurs des régions de Bafata et Gabu. La mission a été conduite en collaboration avec les autorités techniques régionales et sectorielles, les autorités traditionnelles, les agriculteurs et les éleveurs. L'objectif de la mission est d'identifier les sites vulnérables au changement climatique pour un éventuel appui dans le cadre de la mise en œuvre du Projet, tout en proposant des solutions techniques pour atténuer les impacts du changement climatique sur la vie quotidienne des producteurs et/ou éleveurs. Les appuis portent sur les aménagements hydroagricoles (bas-fonds), construction des abreuvoirs (bassin de rétention des eaux pluviales où mini-barrage) pour les bétails et les points d'eau pour le ravitaillement de la population en eau potable.

II. Contexte

Au cours des années 1950, la zone de projet était très riche en eau. Les ressources en eau proviennent d'une part des pluies, d'autre part des apports des bassins des fleuves Corubal, Geba et Cachéu. La pluie constitue la principale ressource en eau douce pour la production agricole. Mais, une réduction tendancielle, pendant les dernières années,

est enregistrée tant pour les précipitations aussi bien que pour la période pluvieuse. Si dans les années 1950 les périodes sèches et pluvieuses étaient répandues chacune sur la moitié de l'année, la tendance pluviométrique, dans les dernières 50 années, démontre un décroissement quantitatif et qualitatif des pluies. Ce qui implique l'augmentation de la période de déficit en eau pour les activités agropastorales. Aujourd'hui, la période sèche a gagné un mois sur la saison pluvieuse. Dans cette zone, la saison des pluies s'étend du mois de juin jusqu'au mois d'octobre.

Malgré ce modeste potentiel en eau douce, sa distribution dans l'espace et dans le temps est très irrégulière avec des périodes d'excès (août, septembre) et périodes déficitaires (octobre à juin), le déficit mensuel pouvant dépasser les 100mm (janvier à mai). Donc, le manque des infrastructures hydrauliques pour la gestion des eaux de ruissellement constitue un problème ne permettant pas toujours aux cultures vivrières de boucler leur cycle de production végétative ce qui contribue à une baisse chronique des rendements et ainsi, la sécheresse et le manque d'eau rendent l'activité de l'élevage plus difficile et moins productive.

Les activités humaines liées à l'exploitation irrationnelle des ressources forestières et à la pratique de l'agriculture itinérante sur brûlis dans les bassins versants ont contribué à la déforestation et la dégradation des sols, non seulement au niveau des plateaux mais aussi au niveau des bas-fonds. L'érosion des sols, provoquée par l'écoulement pendant l'hivernage, a conduit l'ensablement de plusieurs bas-fonds surtout dans les régions de Gabú et Bafatá.

Dans ce contexte, il devient impératif aux producteurs de s'adapter au changement climatique en adoptant des systèmes et infrastructures hydrauliques nécessaires à la maîtrise et à la gestion de l'eau en vue d'une production végétale et animale pouvant couvrir les besoins alimentaires.

III. Logique de choix des sites et groupes cibles

Les sites sélectionnés s'inscrivent dans le cadre d'une démarche visant à soutenir les efforts des paysans (cultivateurs et éleveurs) en matière d'adaptation aux changements climatiques pour maintenir et accroître la production végétale et animale essentielles pour la sécurité alimentaire et nutritionnelle, à savoir le riz, la viande et du lait. Le couloir, constitué par les secteurs administratifs de Pitche, Pirada, Gabú et Sonaco dans la région de Gabu et Contubuel et Ganadu dans la région de Bafatá, est le plus touché par les effets du changement climatique, plus vulnérable en

terme des infrastructures d'adaptation et où le déficit en eau est la plus importante au niveau du pays, l'insécurité alimentaire et nutritionnelle est plus accentuée.

Le groupe cible serait l'ensemble des petits producteurs et éleveurs, particulièrement les femmes productrices du riz et éleveuses qui sont souvent les premières victimes, mais aussi les actrices principales de la lutte contre l'insécurité alimentaire, regroupés dans un village et/ou groupe de villages partageant un espace commun, dont les intérêts convergent, les producteurs et/ou éleveurs déjà engagés, avec une expérience dans les domaines d'activités où la volonté marquée par une initiative concrète.

IV. Les sites identifiés par la mission

4.1. Approche méthodologique

Une première liste de villages et sites potentiels a été établie lors des séances de travail avec les directions régionales de l'agriculture et de l'élevage de Gabu et Bafatá. La zone ciblée a été volontairement limitée aux régions de Gabú, secteurs de Pitche, Pirada, Gabú et Sonaco et de Bafata, secteurs de Contuboel et Ganadu, selon la logique ci-dessus décrite au paragraphe 3 et, dont le potentiel rizicole aménageable et le nombre du cheptel sont importants. Ensuite la mission s'est rendue dans les villages présélectionnés pour les entretiens avec les paysans (agriculteurs et/ou éleveurs) et sur leurs sites respectifs pour la reconnaissance et le diagnostic des problèmes d'exploitation.

Pendant la mission, l'équipe a visité plusieurs villages et sites dans les deux régions. Dans chaque région et dans chaque village, l'équipe a procédé à un échange avec les autorités régionales, les producteurs, les rizicultrices et les éleveurs sur leurs activités agropastorales et les principales contraintes. Les discussions sont suivies des visites conjointes sur les sites proposés par les villageois. Durant les échanges, les observations et collectes d'informations sont faites à partir des explications des personnes ressources et des producteurs/éleveurs.

Dans l'ensemble des villages/sites visités par la mission la contrainte majeure identifiées par les paysans et éleveurs qui a contribué à la baisse de rendements des activités agropastorales est le déficit en eau

d'irrigation pour boucler le cycle végétatif. Au-delà du problème d'eau, les bas-fonds sont confrontés aux problèmes de baisse de la fertilité avec pour corolaire, la forte présence des mauvaises herbes de familles de graminées et de certaines légumineuses, surtout le Striga. Les potentiels bénéficiaires ont aussi relevé le manque de matériels, d'équipements et intrants agricoles, de matériels de conservation post-récolte et l'insuffisance d'appui technique.

Relativement aux activités d'élevage, le manque d'eau a fait baisser le niveau phréatique dans les zones humides avec pour conséquence, la diminution de la croissance et de la production des plantes fourragères ainsi que l'aggravation de la difficulté de l'abreuvement du bétail. Les éleveurs sont obligés de puiser de l'eau dans la majorité des cas à une profondeur qui varie entre 10 à 30 mètres pour abreuver, parfois, plus de 100 têtes de bétails. Aussi, la plupart des éleveurs sont-ils obligés de pratiquer la transhumance à longue distance.

Les activités maraîchères sont pratiquées dans presque tous les villages, comme source de revenus très importants pour les femmes pour assurer les frais de la scolarité et de soins médicaux aux enfants. Mais, les principales contraintes pour le développement du maraichage sont le manque d'eau, l'invasion des animaux et le manque d'accès aux petits matériels et intrants agricoles.

4.2. Sites retenus par la mission de formulation

Un total de 18 sites a été retenu, pour les éventuelles interventions du projet en préparation, à savoir :

1. Site de Bucuré Boboti – Région de Gabú, secteur de Pitche
2. Site de Copiro – Région de Gabú, secteur de Pitche
3. Site de Sago/Fulamori – Région de Gabú, secteur de Pitche
4. Site de Soncocunda – Région de Gabú, secteur de Pirada
5. Site de Sissaucunda – Région de Gabú, secteur de Pirada
6. Site de Durabali – Région de Gabú, secteur de Pirada
7. Site de Sambataco – Région de Gabú, secteur de Pirada
8. Cumpaghor – Région de Gabú, secteur de Gabú
9. Site de Bada – Région de Gabú, secteur de Gabú

10. Site de Colicunda – Région de Gabú, secteur de Sonaco
11. Site de Madina Sara – Région de Bafatá, secteur de Contuboel
12. Site de Manatu Mansona – Région de Bafatá, secteur de Contuboel
13. Site de Calugada – Région de Bafatá, secteur de Contuboel
14. Site de Sanecunda – Région de Bafatá, secteur de Contuboel
15. Site de Suna Nhamabé – Région de Gabú, secteur de Contuboel
16. Site de Cuncana – Région de Bafatá, secteur de Ganadu
17. Site de Pacua – Région de Gabú, secteur de Ganadu
18. Site de Cantacunda – Région de Gabú, secteur de Ganadu

V. Brève description et synthèse du diagnostic des sites identifiés

5.1. Sites de la région de Gabú

5.1.1 Site de Bucuré Boboti

Le village de Bucuré Boboti est lié à la route régionale Gabu-Bruntuma par une piste rurale de 7 km. La piste est conçue pour une circulation limitée en un sens unique à la fois. Cette piste est caractérisée par des nombreux points hautement dégradée par les eaux de ruissellement et cours d'eau qui la rendent, pendant les fortes pluies, non carrossable. Le village est de petites tailles avec une quinzaine de maisons, habitées par les agriculteurs et éleveurs dont la population est environ 138 habitants.

Le mode d'acquisition des terres à Bucuré Boboti est par héritage. La terre n'est en aucun cas à louer, mais elle peut être prêtée sans intérêt. Il n'existe donc pas de conflits fonciers au niveau de ce site.

Le bas-fond identifié se situe aux alentours du village et constitué d'une dépression avec une surface potentielle exploitable d'environ 50 hectares, large et plat. Elle est alimentée en eau par le ruissèlement d'un petit bassin versant et une monté de la nappe phréatique.

Selon les exploitants, l'inondation de la partie la plus basse se vérifie seulement en août et se sèche presque immédiatement après la saison des pluies.

D'une façon générale, dans le plateau, la forêt naturelle du bassin versant de la vallée est déboisée du fait de l'activité humaine et donc sensible aux érosions.

Malgré le faible rendement, la production rizicole est pratiquée au niveau de ce bas-fond par les rizicultrices des 4 villages : Bucure-Boboti, Bucure-Dulo, Sintchã Dara et Sintchã Barros. En 2015, le site a été inondé.

La préparation des sols est manuelle pour la majorité des femmes exploitantes. Un nombre réduit des femmes est appuyé par leurs maris qui font le labour avec la charrue à bœuf. Le semis est à la volé. Les producteurs n'utilisent pas les intrants comme les engrais chimiques et pesticides. Ils utilisent les semences des variétés locales.

Bien que la taille des villages est moyenne, les habitants possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages autour de Bucuré Boboti, le nombre du cheptel est estimé à 1100 têtes de bovins. Pour assurer l'eau pour des centaines des bétails les éleveurs creusent et tirent l'eau de puits traditionnel. À 400 mètres du village, la piste rurale qui le relie à la route régionale traverse un cour d'eau avec un petit lac qui conserve l'eau jusqu'au mois de janvier. Le relief de ce petit cour d'eau permet, avec un aménagement, de créer un bassin culinaire pour l'abreuvement du cheptel de la zone.

En terme d'hydraulique villageoise, le village ne dispose pas de point d'eau potable pour la consommation humaine, ni pour les bétails, ainsi que pour les élèves à l'école.

Les principaux problèmes diagnostiqués pour les villages de la zone sont les suivants :

- ✓ Les bassins versants, pratiquement sans couverture végétale
- ✓ Difficultés de drainage des parcelles situées au centre du bas-fond pendant les crues et inondation des parcelles pendant les pluies intenses
- ✓ Absence du know how pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour l'irrigation des cultures et l'abreuvement du bétail
- ✓ Manque d'infrastructures d'approvisionnement en eau pour les bétails.

5.1.2 Site de Copiró

Le village de Copiró se situe à 1 km de la route régionale Gabu-Bruntuma et lié à celle-ci par une piste. C'est un grand village avec une population d'environ 138 habitants.

Au niveau de ce site il n'y a pas de terres sans propriétaire et le mode d'acquisition des terres dans ce village est par héritage et chaque famille connaît les limites de sa terre et la gère au besoin de tous les membres. En cas d'insuffisance ou d'abondance, elle peut être empruntée ou prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de ce site.

En termes d'hydraulique villageoise, le village bénéficie d'un point d'eau équipé par une pompe manuelle pour l'exhaure. Ce point d'eau n'arrive pas à satisfaire les besoins de la population.

Le site de rizière n'est pas visité par la mission, parce que, selon les bénéficiaires rencontrés, l'eau pour la production rizicole ne constitue pas un grand problème et le cour d'eau qui abreuve le bétail se tarit à la veille de la saison des pluies. Le village a un bas-fond de 111 hectares, cultivé par 10 villages incluant le village de Copiro : Binam, Sintchan Mali, Sintchan Malam, Madina Copiro, Cupé, Rauna, Canhamando, Afia et ville de Pitche. Le bas-fond a été partiellement aménagé par l'OMVG en 2007.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre elles sont appuyées par les maris en labourant avec les charrues à traction animale.

Les principaux problèmes rencontrés par les exploitantes de bas-fond sont:

- ✓ La non maîtrise d'eau et la faible fertilité des sols,
- ✓ L'ensablement et la forte présence des herbes indésirables de la famille graminées et légumineuses surtout le Striga,
- ✓ Le manque de matériels et intrants agricoles, des équipements post-récolte et d'appui technique.

5.1.3 Site de Sagoia/Fulamori

Le village de Fulamori est implanté dans la rive gauche du fleuve Corrubal, à peine une dizaine de mètres. Il est à 12 km au sud-est de la ville de Pitche et relié par une piste rurale, récemment aménagés par

OMVG. Elle termine à Fulamori sous forme d'une rampe d'accès au bac qu'assure la traversée du fleuve vers la République de la Guinée.

Le village est de petite taille avec une quinzaine des maisons, dont la population est environ 138 habitants, mais il est entouré de plusieurs villages dont l'activité principale est l'élevage. Sa proximité à la source d'eau pérenne le transforme en vrai centre de pâturage pendant les mois les plus déficitaires en eau. Les données du service vétérinaire régional indique, pour l'ensemble des villages au tour de Fulamori, que le nombre du cheptel est estimé à 1100 têtes de bovins. Les troupeaux proviennent des villages de Sagoia, Rauna, Benfica, Païama, Canhamando, et Bentem Misside.

Le fleuve Corrubal dispose d'une cour d'eau permanente et il est la source d'eau plus utilisé pour l'abreuvement du cheptel de la zone, malgré son accès très difficile pour les animaux. Pendant notre visite la différence entre la côte du terrain naturel et la côte du plan d'eau était approximativement de 15 mètres et une pente d'environ 1/2. Certainement, pendant l'étiage (les mois d'avril, mai et juin) la différence ci-dessus mentionnée sera plus importante.

Actuellement, la rampe d'accès au bac est aussi utilisée par les troupeaux des bovins pour s'abreuver. Bien sûr, cette situation complique la gestion de la rampe en particulier et du transport en général et met en danger la vie des uns et des autres. Lors de l'aménagement de la piste, la construction des rampes d'accès spécifique pour l'abreuvement du cheptel a été envisagée, mais une raison, hors connaissance des populations, les travaux n'ont pas été réalisés.

Un éventuel aménagement de plusieurs rampes d'accès au fleuve facilitera la conduite des troupeaux par les éleveurs de la zone.

Les problèmes principaux diagnostiqués pour les villages de la zone sont les suivants :

- ✓ Accès à la source d'eau pour l'abreuvement du bétail très difficile
- ✓ Les fortes probabilités d'accident dans l'exploitation de la rampe d'accès au bac pour les transporteurs et à l'eau pour les troupeaux.
- ✓ Manque d'infrastructures d'approvisionnement en eau pour les bétails.

5.1.4 Site de Soncocunda

Le village de Soncocunda se trouve au sud de la ville de Pirada. Il est lié à la route régionale Gabu-Pirada par une petite piste rurale de 5 km. Elle est carrossable pendant toute l'année, grâce à sa faible pente et absence des cours d'eau.

En terme de taille, le village de Soncocunda est grand et peuplé par 1300 habitants. Soncocunda partage le même espace tant pour la riziculture que pour le pâturage avec 5 villages à savoir : Soncocunda, Sissaucunda Samanco, Sissaucunda Aliu, Golere, Sintchan El Laube. La population de la zone est estimée en 3000 personnes et le nombre du cheptel est évalué en plus de 2000 têtes.

Le site de la rizière exploité par l'ensemble des villages, se trouve à 1,5 km du village Soncocunda. Il est très vaste avec un potentielle aménageable de 150 ha. La rizière fait partie de la plaine de fleuve Bidigor. En terme topographique, le site est plat avec une petite cour d'eau mal définie qui se tarit rapidement après la saison des pluies. La rizière est alimentée en eau de pluie par un petit bassin hydrographique. C'est-à-dire quelques heures après les pluies le bas-fond reste sans eaux parce qu'ils écoulent vers la rivière Bidigor situé à quelque mètre du bas-fond. Cette année, ce phénomène arrivé en pleine période de floraison du riz menaçant la production de la majorité des parcelles dans le bas-fond. Le manque des intrants, des matériels agricoles, la baisse de la fertilité des sols, la forte présence des mauvaises herbes des familles graminées et certaines légumineuses ainsi que le Striga, l'ensablement de bas-fond causé par l'érosion hydrique sont les contraintes de la production rizicoles au niveau de site.

La préparation de sols est manuelle pour la majorité des femmes et pour la minorité est en charrue bovine avec l'appui des leurs maris. Les producteurs appliquent le semis direct et utilisent les variétés locales suivantes : Herbel (60 jours) ; Mussé Hu¹ (C4- 90 jours) ; Adulai, Fulantcho et Nhada (120 jours).

Concernant l'élevage, il a un manque d'eau. Pour alimenter les bétails en eau les éleveurs creusent et tirent l'eau des puits traditionnel dont les profondeurs varient entre 10-15 mètres

Les problèmes principaux diagnostiqués pour le village/site de la zone sont les suivent :

- ✓ Les versants, pratiquement sans couverture végétal
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence du know how pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures et abreuvement du bétail.
- ✓ Insuffisance d'infrastructures d'approvisionnement en eau pour les bétails.

5.1.5 Site de Sissaucunda Aliu

Le village de Sissaucunda Aliu se situe dans le même axe avec le village de Soncocunda. Les deux villages partagent la même piste et rizière, et Sissaucunda est à 2 km au sud de Soncocunda.

Le village de Sissaucunda et le voisinage (villages de Sissaucunda Aliu, Sissaucunda Samanco, Nhapo, Golere, Soncocunda et Sintchā El Laube ont bénéficiés d'un mini-barrage en terre avec un seuil en béton armé, construit par OMVG, mais son lac tarit en février, selon les paysans ceci est due à l'ensablement du lac par le ruissellement pendant les fortes pluies. Le fait a été constaté par la mission. Dans l'état actuel le mini-barrage n'arrive pas à résoudre le problème de l'abreuvement du bétail dans la zone. Alors que ceci constitue un véritable casse-tête des éleveurs. Pour régler ce problème, il faudra une intervention ponctuelle.

5.1.6 Site de Durbali

Le village de Durbali se trouve à proximité de village historique de Cansala (Capitale de l'empire de Gabu). Facile accès, lié à la route régionale Gabu-Pirada par une piste rurale de 3 km. Elle est carrossable pendant toute l'année.

La population de l'ensemble des villages qu'exploite la rizière est approximativement 600 personnes répartie en trois villages, à savoir : Durbali, Madina Bocar et Lumbutugo. Au niveau de ce site il n'y a pas des terres sans appartenance de quelqu'un et le mode d'acquisition des terres dans ce village est par héritage et chaque famille connaît les limites de sa terre et la gère au besoin de tous les membres. En cas d'insuffisance ou d'abondance, elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Durbali a une superficie d'environ 60 hectares et en terme topographique, elle présente une configuration non homogène, peu plat, étroite, dont la largeur ne dépasse pas 40 mètres et assez longue. Le site est bien alimenté en eau douce par un bassin versant et possède une cour d'eau temporaire. Son déclive transversale est accentuée, tandis que celle longitudinale est faible. Malgré la complexité de sa configuration et son lit mal défini (la côte du lit est presque égale à la côte du reste de bas-fond), l'écoulement superficiel et le drainage des eaux de ruissellement se passe assez bien, même après les fortes pluies. Le bassin versant est partiellement déboisé pour la pratique de l'agriculture de plateau et ceci est aggravé par intense activité pastorale.

Au niveau de site, le mode de la préparation des sols est manuel et à la traction animale (la charrue). Le riz est cultivé en pépinières et repiqué après 30 jours dans un champ définitif. Les variétés utilisées sont locales et sont : cural (90 jours résistante à la sécheresse) ; Sorilumbato, Bissau et Rasta tous (plus au moins 120 jours). Les producteurs n'utilisent pas des engrais et pesticides.

Les contraintes de la production rizicole au niveau de ce site sont : la présence des herbes indésirables des familles graminées et certaines légumineuses, le manque des matériels et intrants agricoles, le manque des équipements post-récolte et d'appui technique.

Les problèmes principaux diagnostiqués pour le village/site de la zone sont les suivants :

- ✓ Les versants, pratiquement sans couverture végétal
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures et appui technique.

5.1.7 Site de Samba Taco

Le site de Samba Taco regroupe plusieurs villages autour de la vallée de la rivière Bidigor. La population totale de l'ensemble des villages totalise 500 personnes. Au niveau de ce site, le mode d'acquisition des terres est par héritage et chaque famille connaît les limites de sa terre et la gère au besoin de tous les membres. En cas d'insuffisance ou d'abondance, elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de

site. Une partie de la vallée est exploitée exclusivement pour le pâturage des troupeaux.

La vallée de Samba Taco a une superficie estimée en 50 ha, dont environ 20 ha est cultivés pour la production du riz. La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. Les contraintes de la production rizicole au niveau de ce site sont : la présence des herbes indésirables des familles graminées et certaines légumineuses, le manque des matériels et intrants agricoles, le manque des équipements post-récolte et d'appui technique.

En terme topographique, elle présente une configuration homogène, plat et avec une largeur variable. La vallée est bien alimentée en eau douce par un bassin versant et possède un lit mineur temporaire qui se tarit seulement en janvier. La déclive transversale, du plateau vers le fond de la vallée est accentuée, tandis que celle longitudinale est faible.

Samba Taco et les villages voisins possèdent un nombre important de bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre de cheptel est estimé à 2000 têtes de bovins.

Le bassin versant est partiellement déboisé pour la pratique de l'agriculture de plateau et ceci est aggravé par l'intense activité pastorale dans la zone.

Les problèmes principaux diagnostiqués pour le village/site de la zone sont les suivants :

- ✓ Les versants, pratiquement sans couverture végétale
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour l'adoption de mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour l'irrigation des cultures
- ✓ Manque d'infrastructures d'approvisionnement en eau pour le bétail.

5.1.8 Site de Cumpaghor

Le village de Cumpaghor se trouve à proximité de Gabú, facile d'accès, il est au bord de la route régionale Gabú-Pirada. La population totale de l'ensemble des villages totalise 500 personnes.

Le mode d'acquisition des terres à Cumpaghor et autres villages est par héritage et au niveau de cette site il n'y a pas des terres sans appartenance de quelqu'un. Chaque domaine familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. Les terres n'est en aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Cumpaghor a une superficie exploitable d'approximativement 100 hectares et en terme topographique, elle présente une configuration homogène, plate, étroite, dont la largeur moyenne ne dépasse pas 50 mètres. Elle est longue et dessert plusieurs villages, tels que Cumpaghor, Canhanque, Sintchan Aladje, Sintchan Luntam, Sintchan Bricama, Amedalae. Le site est bien alimenté en eau douce par un bassin versant relativement grand, avec un cours d'eau permanent pendant les mois d'août, septembre, octobre et novembre. La configuration de site de Cumpaghor, malgré que son lit mal défini (la cote du lit est presque égale à la cote du reste de bas-fond), l'écoulement superficiel et le drainage des eaux de ruissellement se passe assez bien, même après les fortes pluies. Pour les années humides cette situation favorise la production, mais au contraire pour les années sèches la situation aggrave le déficit en eau d'irrigation. Le bas-fond a été partiellement aménagé par une ONG en 2007.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. Les variétés les plus utilisées sont les suivantes : Nerica L14 et Nerica L19- 120 jours, DEPA-90 jours, Sahel 94-115 jours. Le riz est cultivé en pépinières et repiqué après 30 jours dans un champ définitif.

Les principales contraintes de bas-fond sont : la non maîtrise totale d'eau, la baisse de la fertilité des sols, la forte présence des mauvaises herbes de la famille de graminées et de certaines légumineuses, l'ensablement causé par l'érosion hydrique, le manque de matériels agricoles, le manque des intrants agricoles, le manque des équipements post-récolte, le manque d'appui technique.

Le bassin versant est totalement déboisé pour la pratique de l'agriculture de plateau, ce qui le rend très exposé à l'ensablement par érosion hydrique.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Les versants, pratiquement sans couverture végétal
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures

5.1.9 Site de Bada

Le village de Bada se situe dans les alentours de la ville de Gabú. Il est assis au long de la route régional Gabú-Pirada. C'est un grand village, avec une centaine des maisons, dont la population est environ 1000 habitants. Le mode d'acquisition des terres, tels que dans la majorité des villages en Guinée-Bissau, se fait par héritage, chaque ménage a ses propres terres qu'il peut prêter sans intérêt. Les conflits fonciers sont rares et s'il arrive à avoir lieu, sont généralement réglés à l'amiable ou à travers des sages du village.

La rizière desserve non seulement la population de Bada, mais aussi des villages de Coiada, Djibata, Sancalancunda, Lenquirim, Mamadu Embalo et une partie de la population de Gabú et fait partie de la plaine de fleuve Campossa avec une superficie potentielle aménageable de 150 hectares. En terme topographique, le bas-fond est profond et plat, alimenté en eau douce par un bassin hydrographique assez grand et la nappe phréatique que se trouve presque à la surface du bas-fond. Le bassin versant est totalement déboisé pour la pratique de l'agriculture de plateau et ceci est aggravé par la densité populationnelle élevée. Le site souffre d'une dégradation due aux érosions et aussi due aux déchets solide des ménages venant de la ville de Gabú. Une partie de ce bas-fond a fût objet d'un aménagement par une ONG en 2008.

La pratique de préparation des sols est manuelle par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale Les variétés les plus utilisés sont les suivantes : Nerica L14 et Nerica L19- 120 jours, DEPA-90 jours, Sahel 94-115 jours. Parmi les contraintes de la production rencontrés par les producteurs, on peut citer la baisse de la fertilité des sols, la forte présence des mauvaises herbes de la famille des graminées et de certaines

légumineuses, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Les problèmes principaux diagnostiqués pour le village/site de la zone sont les suivants :

- ✓ Les versants, pratiquement sans couverture végétal
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Dégradation de la terre agricole par l'ensablement et par dépôt des déchets solide inorganique des citadins de Gabú.

5.1.10 Site de Colicunda

Le site de Colicunda dessert plusieurs villages autour de la vallée, notamment : Nemataba, Velingara, Sintchã Bacar et Iero Maro. La population totale de l'ensemble des villages totalise 1500 personnes. Au niveau de ce site, le mode d'acquisition des terres est par héritage et chaque famille connaît les limites de sa terre et la gère au besoin de tous les membres. En cas d'insuffisance ou d'abondance, elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La vallée de Colicunda a une superficie estimée en 70 ha. En terme topographique, elle présente une configuration non homogène, plat dans sa partie centrale et avec une largeur, de l'amont vers l'aval, variable de quelques dizaines de mètres à plus de 50 mètres. La vallée est bien alimentée en eau douce par un bassin versant et possède un lit mineur temporaire qui se tarit en décembre. La déclive transversale, de la vallée est accentuée, tandis celle longitudinale est faible.

Malgré le problème chronique de manque d'eau pour boucler le cycle végétatif et plusieurs contraintes de la production, tels que : la baisse de la fertilité des sols et du rendement, la forte présence des mauvaises herbes, le manque de matériels et intrants agricoles et le manque d'appui technique et encadrement, la rizière est à 90% cultivée. La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale.

Une ceinture de la manche forestière est bien conservée, au long des deux versant immédiate de la vallée. Malgré la conservation forestière du versant, le risque d'ensablement demeure un problème pour les exploitants de la rizière.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures.

5.2. Sites de Bafatá

5.1.11 Site de Madina Sara

Le village de Madina Sara se situe sur la route nationale Bafata-Cambadjú (frontière Sénégal) à proximité de Contuboel, facile accès. La population totale de l'ensemble des villages totalise 500 personnes.

Le mode d'acquisition des terres à Madina Sara et autres villages est par héritage et au niveau de cette site il n'y a pas des terres sans appartenance de quelqu'un. Chaque domain familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. La terres n'est un aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Madina Sara a une superficie exploitable d'approximativement 50 hectares et en terme topographique, elle présente une configuration homogène, plate, étroite et bien assise, dont la largeur moyenne ne dépasse pas 35 mètres. Elle est longue et desserve plusieurs villages, tels que Madina Sara, Cansama, Sitchã Demba Djau, Sitchã Django, Bricama, Sindjã Demba et Sitchã Mamadu. Plus en amont, ce bas-fond est partagé avec les villages de Galugada, Taltó, Sare Djeno, Cambadjú et Sitchã Djida. Au niveau du village, Madina Sara, le site est bien alimenté en eau douce par un bassin versant relativement grand, avec un cour d'eau permanent pendant les mois d'août, septembre, octobre et novembre. Malgré que dans certains points le lit est mal défini, surtout en amont de Madina Sara, l'écoulement

superficiel et le drainage des eaux de ruissellement se passent assez bien, même après les fortes pluies. Pour les années humides cette situation favorise la production, mais au contraire pour les années sèches la situation aggrave le déficit en eau d'irrigation.

Bien vrais que les versants sont couverts par une couche de forêt semi-dense, la route qui traverse le bas-fond constitue le principal facteur d'ensablement des rizières.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. La technique utilisée est le repiquage. Le riz est cultivé en pépinières et repiqué après 30 jours dans un champ définitif. Les variétés utilisées sont : uancaran, Banimalo, Demeremedjel tous 90 jours et Marosirem 120 jours. Ce même bas-fond est utilisé par les femmes dans les activités de maraîchage pendant la saison sèche.

Les principales contraintes de bas-fond sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes de la famille de graminées et de certaines légumineuses, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Madina Sara et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovin. Mais, grâce à l'appui de la Coopération Espagnole, le village bénéficie d'un forage à gros débit équipé avec une citerne élevée, alimentés par électropompe solaire et deux abreuvoirs en béton.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures

5.1.12 Site de Manato Mansona

Le village de Manato Mansona se situe à 4 km de la route nationale Bafata-Cambadjú (frontière Sénégal). Il est relié à la route nationale par une étroite piste que bifurque au niveau du village Madina Sara. La piste est carrossable toute l'année, mais avec des points très critiques pendant la saison des pluies. Le village est de petites tailles, avec une dizaine des maisons et une population d'environ 100 personnes.

Le mode d'acquisition des terres à Manato Mansona et autres villages, avec les quels partagent les rizières, est par héritage et au niveau de ce site il n'y a pas des terres sans appartenance de quelqu'un. Chaque domaine familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. Les terres ne sont en aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Manato Mansona, que se trouve à 3 km du village, a une superficie exploitable d'approximativement 120 hectares et en terme topographique, elle présente une configuration homogène, plat et bien assise, dont la largeur moyenne dépasse 100 mètres. Elle est longue et desserve plusieurs villages, tels que Sintchã Samba Djiba, Djabel, Cuncusira, Sintchã Mama, Fataco fula, Sintchã Turé, Braïma Soló, Manato II et Sintchã Bilali/Brále.

Le bas-fond est bien alimenté en eau douce par un bassin versant relativement grand, avec un cours d'eau permanent qui se tarit tout juste après la saison des pluies. Sa configuration favorise le drainage naturel des eaux de ruissellement, malgré son lit défini. Pour les années humides cette situation favorise la production, mais au contraire pour les années sèches la situation aggrave le déficit en eau d'irrigation. Le moyen de préparation des sols est manuel. Les rizicultrices cultivent la terre en utilisant la technique « balinculo » utilisées pour combattre les mauvaises herbes et pour la conservation d'eau. La technique utilisée est le repiquage. Le riz est cultivé en pépinières et repiqué après 30 jours dans un champ définitif. Les variétés utilisées sont les suivantes : Djulukème (90 jours), Banimalo (90 jours) et Djumorouda (60 jours) selon les rizicultrices.

Ce même bas-fond est utilisé par les femmes dans les activités de maraîchage pendant la saison sèche.

Manato Mansona et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble

des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. Mais, ce village ne dispose qu'un puit à grand diamètre que se tarit en février. En terme d'hydraulique villageoise, Manato est défavorisé et le problème d'accès à l'eau potable est un vrai défi journalier pour les habitants. Naturellement, dans cette situation, l'abreuvement du bétail avec l'eau appropriée reste un rêve.

Les principales contraintes de bas-fond sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes surtout le Striga, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Manque d'accès à l'eau potable pour la population et l'eau pour l'abreuvement du cheptel.

5.1.13 Site de Galugada

Le village de Galugada se situe sur la route nationale Bafata-Cambadjú (frontière Sénégal) donc, facile accès. Il est de grande taille avec centaine des maisons et infrastructures d'hydraulique villageoise. La population totalise 1000 personnes.

Le mode d'acquisition des terres à Galugada et dans les avec lesquels il partage les rizières est par héritage et toutes la terre a une appartenance. Chaque domain familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. La terres n'est un aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Galugada est la continuité de celles de Madina Sara, dont l'ensemble de la superficie exploitable est d'approximativement 50 hectares et en terme topographique, elle présente une configuration non

homogène, large, avec la pente transversale accentuée, mais celle longitudinale faible. Au niveau du village, le site est alimenté en eau douce par un petit bassin versant, avec un cour d'eau temporaire pendant les mois d'août et septembre. Malgré la non définition du lit l'écoulement superficiel et le drainage des eaux de ruissellement se passe momentanément, même après les fortes pluies. Cette situation aggrave le déficit en eau d'irrigation et ne favorise pas la production rizicole.

Les versants sont totalement d'éprouvés de la couverture végétale et les rizières sont assujettis à l'ensablement.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. La technique utilisée est le semis a volé à cause d'insuffisance d'eau. Les variétés utilisées sont : Bandjulai, Banimalo, Santandjan, CEFA-PRETO, DEPA tous 90 jours, Djulkéme, Uancaran (90-120 jours), Barrafita, Tabuia (60-90 jours).

Ce même bas-fond est utilisé par les femmes dans les activités de maraîchage pendant la saison sèche.

Les principales contraintes de production dans le bas-fond sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes de la famille de graminées et de certaines légumineuses, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Galugada et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. L'abreuvement des troupeaux se fait par puisage manuel de l'eau à une profondeur moyenne de 15 mètres. Ceci constitue la contrainte majeure pour le développement de l'élevage dans le village.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies

- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Absence des infrastructures pour l'abreuvement du cheptel

5.1.14 Sites de Sanecunda

Le village de Sanecunda se situe à la proximité de la frontière du Sénégal à 6 km de Fajonquito et à 9 km de la route national Bafatá-Cabadjú (frontière Sénégal) Il est relié à la piste Canhamina-Fajonquito par une étroite piste, carrossable toute l'année, mais avec des points très critiques pendant la saison des pluies et en mauvais état de conservation. Le village est de petit taille, un peu isolé, avec près de cinq maisons et une population d'environ 20 personnes sans eaux potable pour la consommation humaine et pour les bétails qui sont nombreuses dans le village. Il a un puits traditionnel creusé par les villageois eux-mêmes que taris pendant la saison sèche, obligeant le déplacement des éleveurs à la recherche des sources d'eau à longue distance.

À quelque dizaine de mètres du village il a un bas-fond où les femmes pratiquent la riziculture. Le mode d'acquisition des terres ici est aussi par héritage. Chaque domain familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. La terres n'est un aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière a une superficie exploitable d'approximativement 30 hectares et en terme topographique, elle présente une configuration homogène, plate et bien assise, dont la largeur moyenne ne dépasse pas 25 mètres. Elle est longue et desserve plusieurs villages, tels que Sanecunda, Maro Baque, Samatiana, Sintchã Framba, Brecolon, Sintchã Bacar et Sintchã Bala.

Au niveau du village, le site est alimenté en eau douce par un petit bassin versant, avec un cour d'eau temporaire pendant les mois d'août et septembre. Malgré la non définition du lit l'écoulement superficiel et le drainage des eaux de ruissellement se passe momentanément, même après les fortes pluies. Cette situation aggrave le déficit en eau d'irrigation et ne favorise pas la production rizicole.

Les versants immédiats du bas-fond sont constitués de savane herbacée (zone de pâturage), donc très sensibles aux érosions hydrique. Cette zone contribue à l'ensablement des rizières.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. Les rizicultrices cultivent la terre en utilisant la technique <<balinculo>> utilisées pour combattre les mauvaises herbes et pour la conservation d'eau. La technique utilisé est semis a volé. Les variétés utilisées sont : Banimalo, Auael, Tabadjenque tous 90 jours ; Baghaghar 90-120 jours.

Les principales contraintes de la production dans ce bas-fond sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes surtout le Striga, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Manque d'accès à l'eau potable pour la population et l'eau pour l'abreuvement du cheptel.

5.1.15 Site de Cuncana

Le village de Cuncana, à priori, ne fait pas parti des villages sélectionnés dans la séance du travail avec la Direction régional de L'agriculture et de l'élevage. Il est situé entre Gã-Mamaudu (ville chef-lieu) du secteur administratif de Ganadú et le village de Pácua. La piste qui le relie à Gã-Mamudu traverse un bas-fond, dont la largeur est estimée en 80 mètres, plat et bien assise. Ce bas-fond est alimenté en eau douce par un petit bassin hydrographique, sen un cours d'eau permanent ni un lit mineur définit. Au fur et en mesure que on avance ver l'aval le cours d'eau deviens temporaire pendant les mois d'août et septembre e le lit se définit.

Le taux de valorisation du bas-fond est au-delà de 95%, mais au moment du passage de la mission le stress hydrique des plantes en pleine floraison, menaçant la productivité de la majorité des parcelles dans le bas-fond, était notable à cause du manque de l'eau d'irrigation. Ce taux de valorisation montre la volonté et engagement des femmes dans la production vivrière pour garantir l'autosuffisance alimentaire à leur famille quel que soit la condition.

Les terres à Cuncana sont acquises par héritage et toutes la terre a une appartenance. Chaque domaine familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. La terres n'est un aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site.

La rizière de Cuncana a une superficie exploitable de plus de 100 hectares et en terme topographique, elle présente une configuration homogène, large, avec la pente transversale peu accentuée, mais celle longitudinale faible. Malgré la faible pente longitudinale le drainage des eaux de ruissellement se passe rapidement, même après les fortes pluies. Cette situation aggrave le déficit en eau d'irrigation et ne favorise pas la production rizicole.

Les versants sont majoritairement couverts par une couche de forêt semi-dense mais, la piste qui traverse le bas-fond constitue le principal facteur d'ensablement des rizières.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. La technique utilisée est le semis à volé à cause d'insuffisance d'eau.

Les principales contraintes de production dans le bas-fond sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes de la famille de graminées et de certaines légumineuses, le manque de matériels et intrants agricoles, des équipements post-récolte et le manque d'appui technique.

Cuncana et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. L'abreuvement des troupeaux se fait par puisage manuel de l'eau à une profondeur moyenne de 15 mètres. Ceci constitue la contrainte majeure pour le développement de l'élevage dans le village.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Absence des infrastructures pour l'abreuvement du cheptel.

5.1.16 Site de Pacua

Le village situé à quelque kilomètre du Gã-Mamudu, ville chef-lieu du secteur administratif de Ganadu. En rentrant, approximativement 250 mètres, la piste qui donne accès au village traverse une vallée, dont la largeur atteint 150 mètres. Cette vallée est exploitée par les femmes du village pour la production du riz. Au-delà de la production rizicole, une des activités du Pácua c'est l'élevage. La piste reste carrossable pendant toute l'année, mais elle est en mauvais état de conservation.

En terme de taille Pácua est un grand village avec plusieurs centaines de maisons. La population de Pácua totalise environ 1500 personnes. Au niveau de ce site, la terre agricole est acquise par héritage et chaque famille connaît les limites de sa terre et la gère au besoin de tous les membres. En cas d'insuffisance ou d'abondance, elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site. Une partie de la vallée est exploitée exclusivement pour le pâturage des troupeaux.

La vallée de Pácua a une superficie potentielle estimée en 180 ha, dont environ 80 ha est cultivés pour la production du riz et le reste sert pour le pâturage. Elle dessert plusieurs villages au tour de Pácua, tels que Candafé, Sintchã Mari, Sintchã Mamadu I, Sintchã Sulai et Sointchã Mamadu II. En terme topographique, elle présente une configuration homogène, plat et avec une largeur variable. La vallée est bien alimentée en eau douce par un bassin versant et possède un lit mineur temporaire qui se tarit immédiatement après la saison des pluies. La déclive transversale, du plateau vers le fond de la vallée est accentuée, tandis que celle longitudinale est faible.

Le bassin versant est partiellement déboisé pour la pratique de l'agriculture de plateau et ceci est aggravé par intense activité pastorale dans la zone.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. La technique utilisé est semis a volé et celle de cultivé la terre est appelée «Balinculo», une technique de lutte contre les mauvaises herbes et de conservation d'eau. Une partie de la récolte est gardée pour la semence. Les variétés utilisées sont : Guireghade, Djundiguide, Banimalo, Barafita, Lancaran, Maliulem, Comoco et Tchamuel- 90 jours ; CEFA COIO (riz blanc) E CEFA PRETO (riz noir)- 60 jours.

Pácua et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. Ce cheptel est abreuvé par le puisage manuel de l'eau à une profondeur de plus de 10 mètres.

Les contraintes de la production rizicole et de l'élevage au niveau de la zone sont : la présence des mauvaises herbes de familles graminées et certaines légumineuses, la baisse de la fertilité des sols, le manque des matériels et intrants agricoles, le manque des équipements post-récolte et l'abreuvement manuel des troupeaux et le manque d'appui et encadrement technique.

Les problèmes principaux diagnostiqués pour le village/site de la zone sont les suivent :

- ✓ Les versants, pratiquement sans couverture végétal
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Manque d'infrastructures d'approvisionnement en eau pour les bétails.

5.1.17 Site de Cantacunda

Le village de Cantacunda est situé à 19 km de Gã-Mamudu (la ville chef-lieu) du secteur du Ganadu. Il est relié à Gã-mamudu par une piste très dégradée avec les tronçons impraticables pendant la saison des pluies. Heureusement, il a une piste alternative utilisée pendant que la voie principale reste impraticable. Le village est de grande taille, avec plus de 50 maisons et une population d'environ 1 200 personnes.

À moins de 200 mètres du village il y a un bas-fond où les femmes pratiquent la riziculture. Le mode d'acquisition des terres ici est aussi par héritage. Chaque domaine familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. Les terres ne sont en aucun cas à location, mais elles peuvent être prêtées sans intérêt. Il n'y a pas de conflits fonciers au niveau de site. Le village de Cantacunda partage le même bas-fond avec Sintchã Bobo, Sare Ganha, Madina, Sintchã Samba, Sintchã Folonco et Sintchã Hoio.

La rizière a une superficie exploitable plus de 150 hectares et en termes topographiques, elle présente une configuration homogène, plate et bien assise, dont la largeur moyenne ne dépasse pas 250 mètres. Elle est longue et dessert plusieurs villages, tels que mentionnés ci-haut.

Au niveau du village, le site est alimenté en eau douce par un bassin versant, avec un cours d'eau temporaire pendant les pluies successives. Malgré la non définition du lit l'écoulement superficiel et le drainage des eaux de ruissellement se passent assez rapidement, même après les fortes pluies. Selon la population rencontrée, le niveau de la lame d'eau peut atteindre 15 cm, mais après quelques jours cette lame est entièrement drainée. Cette situation aggrave le déficit en eau d'irrigation et ne favorise pas la production rizicole.

Les versants immédiats du bas-fond sont constitués de savane herbacée (zone de pâturage), donc très sensibles aux érosions hydriques. Cette zone contribue à l'ensablement des rizières.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre elles sont appuyées par les maris en labourant avec les charrues à traction animale. Les rizicultrices cultivent la terre en utilisant la technique «balinculo» utilisées pour combattre les mauvaises herbes et pour la conservation d'eau. La technique utilisée est le semis à volé. Les variétés utilisées sont : Les variétés utilisées sont : Guireghare, Banimalo,

Sambaroconco, DEPA- 90 jours ; Hotchocoro,Sare Amadi, Sambanconco, Wancaran-120 jours ; Bicente, Mulai-60 jours.

Cantacunda et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. L'abreuvement des troupeaux se fait par puisage manuel de l'eau à partir d'un seul forage équipé avec une pompe manuelle et/ou déplacer à longues distances pour approvisionner les bétails en eau.

Les principales contraintes de la production dans rizicoles et élevages sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes surtout le Striga, le manque de matériels et intrants agricoles, des équipements post-récolte, l'abreuvement manuel des troupeaux et/ou la transhumance et le manque d'appui et encadrement technique.

Les problèmes principaux diagnostiqués pour le village/site sont les suivants :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Absence d'infrastructures adéquate pour l'abreuvement du bétail.

5.1.18 Site de Suna Nhamabé

Le village de Sunna Nhamabé est situé à 3 km Fajonquito et 6 km de la route nationale Bafatá-Cabadjú (frontière Sénégal) Il est relié à Fajonquito par une étroite piste et carrossable toute l'année. Le village est de moyenne taille, avec plusieurs dizaines des maisons et une population d'environ 200 personnes.

À moins de 500 mètres du village il a un bas-fond où les femmes pratiquent la riziculture. Le mode d'acquisition des terres ici est aussi par héritage. Chaque domaine familial est connu par les villageois et chaque famille gère sa terre au besoin de tous les membres. La terre n'est en aucun cas à location, mais elle peut être prêtée sans intérêt. Il n'y a pas de conflits fonciers au niveau de site. Le village partage le même bas-fond avec

Sintchu, Sintchã Tenquenam, Sare Hamadi, Djartó, Mansidi, Sare Pate et Sare Canta.

La rizière a une superficie exploitable plus de 150 hectares et en terme topographique, elle présente une configuration homogène, plat et bien assise, dont la largeur moyenne dépasse pas 250 mètres. Elle est longue et desserve plusieurs villages, tels que mentionnés ci-haut.

Au niveau du village, le site est alimenté en eau douce par un bassin versant, avec un cour d'eau temporaire pendant les pluies successives. Malgré la non définition du lit l'écoulement superficiel et le drainage des eaux de ruissellement se passe assez rapide, même après les fortes pluies. Selon la population rencontrée, le niveau de la lame d'eau peut atteindre 15 cm, mais dans deux jours cette lame est entièrement drainée. Cette situation aggrave le déficit en eau d'irrigation et ne favorise pas la production rizicole.

Les versants immédiats du bas-fond sont constitués de savane herbacé (zone de pâturage), donc très sensibles aux érosions hydrique. Cette zone contribue à l'ensablement des rizières.

La préparation des sols est faite manuellement par la majorité des femmes. Certaines d'entre eux sont appuyées par les maris en labourant avec les charrues à traction animale. Les rizicultrices cultivent la terre en utilisant la technique <<balinculo>> utilisées pour combattre les mauvaises herbes et pour la conservation d'eau. La technique utilisé est semis a volé. Les variétés utilisées sont : Guireghare, DEPA Contuboel, Cinco Male, Mulai, Dimba Modadjo- 60 jours. Banimalo-90 jours.

Suna Nhamabé et les villages voisins possèdent un nombre important du bétail. Par les données du service vétérinaire régional, pour l'ensemble des villages, le nombre du cheptel est estimé à 2000 têtes de bovins. L'abreuvement des troupeaux se fait par puisage manuel de l'eau à partir d'un seul forage équipé avec une pompe manuelle.

Les principales contraintes de la production dans rizicoles et élevages sont : la baisse de la fertilité des sols, la forte présence des mauvaises herbes surtout le Striga, le manque de matériels et intrants agricoles, des équipements post-récolte, l'abreuvement manuel des troupeaux et le manque d'appui et encadrement technique.

Les problèmes principaux diagnostiqués pour le village/site sont les suivent :

- ✓ Ensablement des rizières
- ✓ Difficultés de retenir et gérer les crues pour inonder les parcelles rizicoles pendant la saison des pluies
- ✓ Absence de savoir-faire pour adoption des mesures d'adaptation pour faire face aux problèmes de déficit d'eau pour irrigation des cultures
- ✓ Absence d'infrastructures adéquate pour l'abreuvement du bétail.

VI. Synthèse du diagnostic des sites

Le tableau suivant présente une synthèse des sites identifiés.

INTEGRATED PEST AND PESTICIDES MANAGEMENT PLAN SUMMARY

East Guinea Bissau's agriculture is facing climatic constraints that are manifested by floods and sudden or early droughts that compromise the efforts of farmers.

Although the country possesses significant surface water potential for irrigation development, it escapes rural technique that was called upon to mobilize it for agricultural purposes. It is to support the development of activities to adapt populations to the adverse effects of climate change through the mobilization of water for irrigation and support for the development of the perimeters that the Project "Smart agriculture in the East of Guinea Bissau" has been identified.

Despite the contribution that the project could make for rural development, in particular the improvement of food security and the living conditions of the population, its implementation calls for pests and pesticides management.

This Integrated Pest and Pesticides Management Plan (PGIPP in French) is designed to guide pest and pesticide management activities through sustainable practices that best protect the environment and human health.

0.1. Project Summary

The project, as designed, will address key issues of vulnerability in agriculture and the rational management of water resources in order to contribute to the development and resilience of the immediate and long-term needs of extremely vulnerable farmers.

In line with the country's vulnerability and identified adaptation needs, three specific objectives are pursued within the framework of this project:

- Development of technical and institutional capacity to address climate risks in adaptation practices and planning
- Improving the resilience of existing agricultural productive systems , including water control and water management measures
- knowledge Management and lessons learned on climate smart agriculture and adaptation planning

To achieve the above objectives, the project has been structured into three components:

- Development of technical and institutional capacity to respond to climate risks in adaptation practices and planning
- Increased resilience of agricultural productive systems to climate, including water control and management measures
- Knowledge Management and Lessons Learned on Smart Agriculture

The implementation of the component 2 of the project involves the pest and pesticide management, which requires the preparation of an integrated management plan to ensure sustainable agricultural production.

0.2.Objective of the formulation of Integrated Pests and Pesticides Management Plan

Although the project area is not recognized as an area of pest attack, the development of agricultural activities including food crops and vegetable crops (component 2), calls for preventive and curative pest and pesticide management methods/techniques and therefore the preparation of an Integrated Pest and Pesticide Management Plan (PGIPP).

The development of the PGIPP is based on information gathered in the project area, through consultations with beneficiaries, technical services for plant protection, agriculture, environment, livestock, public health, etc. Field information was complemented by documentary research and analysis on pest and pesticide management.

The objectives of this Integrated Pest and Pesticide Management Plan are to:

- Assess the capacity of the institutional and regulatory framework to promote and implement safe, effective and rational management of pests and pesticides and to integrate the required measures for capacity building;
- Define the rules and techniques to be adopted by the beneficiaries and other stakeholders of the project with regard to the control and management of pests and pesticides;
- Strengthen practices to reduce dependence on chemical pesticides;
- Ensure that negative effects and potential risks to human and animal health and environmental pollution (water, air, soil, etc.) are minimized.

The option for the promotion of integrated pest and pesticide management in the framework of the project is made to considerably reduce the use of chemical pesticides. In case of parasite attack, the least hazardous methods

will be preferred. Chemical pesticides will be used in extreme cases where less dangerous methods will prove ineffective.

0.3. Environment and human aspect of the project area

The project will mainly be carried out in the Bafatà and Gabù regions and will concentrate activities along the alluvial zones (valleys, low-lands or low pressure areas) where initiatives of groups, cooperatives, farming families or micro groups (often women) are developed.

The target population of the project is directly the population of the villages attached to the project intervention sites. Indirectly, the populations of the administrative sectors of Pitche, Pirada, Gabú, Sonaco, Contuboel and Ganadu are concerned.

0.4. Outline of the policy, legal and institutional framework

The study takes into account the environmental and social policy of the Adaptation Fund. The national policy framework for environmental management is included in Act N^o. 1/2011 of March 2, 2011 on the basic Environment Law.

At the legal level, several international and national texts adopted by Guinea-Bissau specifically addressing the protection of the environment will apply to the project.

At the international level, these are:

- the Convention on the biological diversity;
- the Convention on climate change;
- the Convention on Wetlands of International importance such as habitat for water birds known as "RAMSAR convention";
- the Convention on the conservation of migratory species belonging to the said wildlife "Bonn Convention" signed in Bonn (Germany);
- the African convention of phytosanitary;
- the sub-saharian phytosanitary convention;
- the Bamako Convention on hazardous wastes;
- the Convention of Rotterdam ;
- the Basle convention ;
- the Stockholm Convention;
- the Convention de l'Organisation Internationale de Lutte Contre le criquet Migrateur Africain ;
- the international Convention on plant protection;
- the Montreal protocol;
- etc.

At the national level, the obligations, legislative and regulatory provisions for environmental protection applicable to the project are:

- Constitution of the Republic of Guinea Bissau, adopted in 1984 and amended in 1991, 1993, 1996
- Environmental Assessment Act approved by the Government, at the meeting of the Council of Ministers on 19/03/08;
- Forest Law approved by Decree-Law No. 4-A / 91 and published on 29 October 1991,
- Wildlife Act, approved by Legislative Decree No. 2/2004 and published on 14 June 2004,
- Ordinances No. 045 / PRG / 87: Code for the Protection and Development of the Environment

At the institutional level, the implementation of the policy of protection and management of the environment for sustainable development is the responsibility of a multitude of actors including:

- the Ministry of Agriculture (Directorate of Plant Protection (DPV), Directorate of Agriculture (DGA))
- the Ministry of the Environment for Sustainable Development;
- the Ministry of Public Health;
- the Ministry of Livestock;
- the Ministry of Hydraulics and Sanitation;
- the Ministry of Energy and Natural Resources;
- the Ministry in charge of civil protection;
- etc.

Moreover, the registration of pesticides is since 1992, an allocation of CILSS with adoption of Resolution No. 7/17 / CM / 92 relative to *"the Regulations for the Registration of Pesticides in CILSS Member States."* CILSS currently has 13 member countries, including Burkina Faso, Benin, Cape Verde, Côte d'Ivoire, Gambia, Guinea, Guinea Bissau, Mali, Mauritania, Niger, Chad and Togo). With the support of FAO, the regulation of the CILSS was revised in 1999 by Resolution 8/34 / CM / 99 in order to facilitate its ratification by the National Assemblies of the Member States.

0.5.Existing pest and pesticide management strategies

To combat the different pests, the strategies generally used revolve around preventive control and curative control.

Preventive control is widely used in the fight against insects, with material and human means, and a monitoring system set up for this purpose. As for the other

pests, they are generally monitored by the producers themselves, the decentralized services of agriculture and plant protection. This local monitoring makes it possible to identify pests early, areas at risk of infestation and to consequently prepare the curative fight. In addition, the choice of the most resistant varieties, the treatment of seeds, etc. are also used as preventive control methods.

In the curative field, several methods are used:

- chemical control, which is the most widely used method. On the rice-growing and market-garden areas, they are directly treated by the producers themselves for seeds, fruit and vegetable pests, stored crops and for rice herbicide applications. Unfortunately, these producers do not always follow operating procedures and generally do not apply protective measures during applications. This exposes them to health risks related to these products;
- less widespread biological control, which is the regulation of pest populations by introducing their predators and parasites into the same environment;
- mechanical control, which mainly concerns the control of grain-eating birds in rice-growing areas with the most common methods, such as pruning trees to prevent nesting ;
- agronomic or cultural control with methods such as respecting the crop calendar, in particular synchronization of transplanting dates to limit the period of maturation; The uprooting and burning of diseased plants; The removal of alternative hosts, drying of plots of rice, application of ash and reduction of the urea dose; The avoidance of excess nitrogen fertilization; The use of tolerant or disease-resistant varieties.

0.6. Impacts of non-controlled use of pesticides

The use of pesticides is likely to cause changes in the composition of soils and thus their contamination especially if the application is not made according to the standards. There is a risk of declining fertility and soil acidification in the event of misuse of pesticides. Also, if pesticide residues are not well managed after application of the treatment, they will cause soil contamination and pollution as well as the accidental spill. This impact on soils could have potential negative impacts on crop yields, which, however, constitute the intended purpose through the use of these products.

Pesticides and other chemicals (especially unlicensed ones imported fraudulently) to combat pests will have potential negative impacts on surface water resources through runoff and underground by infiltration.

As far as surface water is concerned, the main threat is chemical pollution. As far as groundwater is concerned, the main problem with pesticides is pollution.

- the use of pesticides has effects on air quality. Their application will be a source of contamination of the air and olfactory nuisance.
- wildlife will be affected by pesticides as part of pest control. One of the significant negatives effects of this component concern intoxication, death, etc.

One of the most significant negative impacts of pesticides on humans and animals is poisoning. The main routes of contact between humans and the pesticides that may cause this poisoning are:

- the cutaneous way when pesticides are handled without gloves, when the liquid is spilled on clothing or when the pesticides are mixed with the hand;
- the respiratory tract or inhalation involves exposure to the vapours of the concentrated product vapour during preparation of the slurry, exposure without suitable protective equipment during spraying;
- the consumption of processed agricultural products whose residual period is not respected;
- the digestive tract when siphoning a pipe with the mouth or when smoking or eating without washing hands after application of the pesticides.

In terms of risks, they relate to the application of pesticides to foot applicators, drivers and device handlers, transport: contamination of containers, bursting or spillage of drums; monitoring during treatment or prospecting operations. They concern: field workers and populations, women and children too.

0.7. Action Plan for implementation of Integrated Pests and Pesticides Management of the project

The action plan for implementation of Integrated Pests and Pesticides Management (PGIPP) of the project includes: (i) a integrated pest and pesticide management approach for the project; (ii) principles of intervention; (iii) strengthening the legislative framework for pesticide management; (iv) capacity building of actors through training (v) sensitization for the promotion of the use of alternatives control strategies; (vi) good practices to be adopted during the pesticide management cycle; (vii) measures to be taken in the

event of poisoning; (viii) the monitoring-evaluation plan; and (ix) institutional arrangements for the follow-up of the PGIPP.

a) Approach to Pests and pesticides management in the implementation of the project

Integrated Pest Management (IPM) is concerned with a holistic approach towards pest control techniques, aiming to keep pesticide applications and other interventions within economically justified levels while minimizing any risks (real or potential) to human health or the environment. Natural pest control plays a significant role in IPM, and includes direct and indirect measures (see table below). The present project on Climate-smart agriculture aims to significantly reduce chemical pesticide application already indirectly, where many activities –use of crops adapted to local conditions, reliance on appropriate yield expectations, use of resistant varieties, optimal densification of cultivars, etc. – overlap with indirect plant protection¹.

The option for the promotion of integrated pest and pesticide management in the framework of the project is made to avoid or considerably reduce the use of chemical pesticides. In case of parasite attack, the least hazardous methods will be preferred. Chemical pesticides will be used in extreme cases where less dangerous methods will prove ineffective. In this case, the choice of use of chemical pesticides will be made in accordance with the recommendations of the integrated pest and pesticide management plan. Given that Guinea Bissau does not have sustained experience in integrated pests and pesticides management, it is very important to take into account, the experiences and lessons learned of the FAO in the pests and pesticides integrated management in the Africa's subsaharian countries. It is why, the members of National committee of pest and pesticides management (CNGP), the DPV officers, the PMU, the NGO's representatives in charge of the supervision of beneficiaries on the perimeters will be trained on the integrated management of the pests and pesticides in the project area by an Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries (Please see item d) below). This expert will be recruited by the PMU under the supervision of the Implementing Entity.

At the end of the training sessions, a box of integrated pests and pesticides management tools will be made available to the beneficiaries, the DPV, the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions. **These tools box**

¹ See Climate-Smart Agriculture Sourcebook: FAO, 2013

prepared by the Expert with the FAO experiences in the integrated pests and pesticides management, will indicate the appropriate actions to take on the various pests and pesticides. The tools box will also indicate the limited WHO class U and III pesticides that the beneficiaries can use if the agronomic, cultural, mechanical and biological methods prove to be ineffective in dealing with the problem.

The following approach will ensure coordinated and sustainable management of pests and pesticides in the project framework.

Step 1: Dissemination of pest management alternatives

The alternatives to pesticides as agronomic, cultural, mechanical and biological control will be disseminated for better use by the producers. The resistant seed will be promoted also. This actions will be integrated early the sites or crop development to prevent the attack by pests. The box of integrated pests and pesticides management tools elaborated following the training by IPM Expert will be made available to the beneficiaries.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building on integrated pest and pesticides management.

Step 2 : When an attack of crops by pests is observed on a site, the beneficiaries will use, under the control of the site facilitator and the project regional coordinator, the appropriate alternatives retained in the IPM tools prepared with the support of the IPM Expert on which the beneficiaries, the facilitators and the project regional coordinators have already received training. These alternatives measures will be applied in a spirit of environmental protection and human health. The project regional coordinator will inform the PMU on the adequate actions taken on the perimeter by the beneficiaries to end the attack of pests.

Step 3 : In extreme cases, where alternatives actions will prove ineffective, the regional directorate of DPV, who have also received training from the IPM

Expert, will advise the PMU on the need for limited class III or U pesticides purchases. The use of the WHO class III and U pesticides by the beneficiaries will be done with the support of PMU under the control of the DPV. The National Pesticide Management Committee² (CNGP) will be informed by the DPV and the PMU will inform the BOAD on the process.

The possible alternatives for chemical pest control which can be used in the framework of the project are presented in the table below :

Indirect plant protection	Monitoring and forecasting	Direct plant protection
<p>Optimal use of natural resources:</p> <ul style="list-style-type: none"> • Use crop adapted to local conditions • Rely on appropriate yield expectations • Use of resistant varieties • Weed management with adequate intensity of competition • Adequate mixtures of varieties and crops • Optimal timing of sowing period • Training on pest and appropriate pesticides, particularly biological options, and importance of ecological compensation areas <p>Use of farming practices without negative impact on the agro-ecosystems:</p> <ul style="list-style-type: none"> • No use of surplus input of nutrients (especially N); 	<ul style="list-style-type: none"> • Monitoring and forecasting of pest incidence will be done in accordance with the project's IPM plan. • No specific pest forecast modeling, e.g. via economic injury level and action thresholds, epidemiology and forecast models, is foreseen for this project. If available this can be undertaken in collaboration with third-party projects identified by the Consultant recruited for capacity building 	<p>Use of selective pest control methods:</p> <ul style="list-style-type: none"> • Wherever and whenever adequate, reliance on biological control, biopesticides, etc. <p>Chemical pest control methods, only where other options are failing or will be very likely:</p> <ul style="list-style-type: none"> • Preference for the most specific and selective pesticides (class III and U of WHO) • Preference for least harmful and least toxic pesticides (class III and U of WHO)

²To overcome the problems associated with the uncontrolled use of pesticides and to reduce the risks associated with the use of poor quality pesticides, a National Pesticide Management Committee (CNGP) is set up in Guinea Bissau, Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations, customs. The CNGP ensures, inter alia: (i) the implementation and monitoring of compliance with pesticide quality control procedures and standards; (ii) post-registration control of pesticides; (iii) compliance monitoring of pesticides; Control of the distribution and use of pesticides; (iv) control of Maximum Residue Limits (MRLs) of imported products for local consumption; (v) control of professionals in the pesticide industry; (vi) Maintaining the register of operators in the sector; (vii) the maintenance and updating of registered pesticides; (viii) denunciation of unauthorized pesticides entering the country; (ix) monitoring of toxicovigilance; (x) monitoring of pre-extension trials; (ix) monitoring the implementation of international pesticide conventions.

<ul style="list-style-type: none"> • Optimal density of crop and foliage to facilitate ventilation • Low intensity of tillage/cultivation and production methods protecting soil fertility • Weed management for erosion control • Biodiversity conservation and protection to enhance biodiversity, therefore reducing pest incidence • Where adequate protection and augmentation of beneficial biological antagonists. 	<p>on integrated pest and pesticides management.</p>	
--	--	--

b) Principles for intervention

The management of pests and pesticides in the project should address the following principles:

- Caution and attention;
- Strengthening the capacities of stakeholders on integrated pests and pesticides management;
- Traceability of the products used;
- Coordination and intersectoral cooperation;
- Information and management of data relating to the integrated management of pesticides;
- Rationalization and strengthening of supervisory structures and risk prevention;
- Monitoring and evaluation ;
- Monitoring of health and environmental impact;
- Effectiveness of the participation of all stakeholders;
- Promotion of integrated pest management in extension / producer information systems (for integrated pest management, the 16 internationally recognized core principles will be implemented, annex 3 of this document).

c) Strengthening the legislative framework for pesticide management

It consists to :

- Promote incentives measures to encourage the use of agronomic, cultural, mechanical and biological pest control methods to significantly reduce the use of chemical pesticides ;
- Vulgarize the integrated pest and pesticides management.

d) Strengthening technical capacities on integrated pest and pesticide management

The project will organize capacity-building sessions on integrated pest and pesticides management for actors involved in the project. The capacity building will be focused on alternatives to pesticides as agronomic, cultural, mechanical and biological control. These are the techniques or actions that are taken into account in crop development to prevent pest outbreaks and avoid or greatly reduce the use of chemical pesticides (alternatives of chemical pesticides use are presented in integrated pest management approach at the page 123 of this document). The capacities building on integrated pest and pesticides management will concern at least the following institutions and individuals: Regional Directorate for Plant Protection, National committee of pest and pesticide management (CNGP in French)³; Regional Directorate for Environment and Sustainable Development, Regional Directorate for Agriculture, Regional Directorate for agriculture water infrastructures management, representative of the Governorate of the Region, Competent Authority for Environmental Assessment (AAAC in French) , Regional Directorate for Public Health, National Laboratory for Agrarian Research (INPA in French), Members of Perimeters' Management Committee, NGO's representatives in charge of the supervision of the beneficiaries on sites, the PMU and the presidents and administrators of the perimeters will be trained on the integrated management of pests and pesticides-

This training will be conducted by an Expert very experienced in the FAO integrated pest and pesticides management in the Africa's subsaharian countries. This expert will be recruited by the PMU under the supervision of the Implementing Entity on the basis of a shortlist of Experts recommended by the FAO office based in Rome (Italy) and or in West Africa in Accra (Ghana).

At the end of the training sessions, the tools box of integrated pests and pesticides management will be made available to the beneficiaries, the DPV,

³ The National pest and pesticide management committee (CNGP) is set up in Guinea Bissau by the Article 11 of Legislative Decree No. 7/2000 of 24 August 2000. This committee is composed of members from such structures as the environment, health, agriculture, farmer organizations and customs.

the PMU, the CNGP and the Regional Directorate for Agriculture for appropriate integrated pests and pesticides management actions.

For the integrated pest and pesticides management and others sustainable activities in the project framework, the project will strongly collaborate with the regional offices (CILSS in Ouagadougou (Burkina Faso, AGRHYMET in Niamey (Niger), EMPRES-FAO (Prevention of major pests upsurges in West and Northwest Africa)) involved in sustainable agriculture development.

e) Sensitization for the promotion of the use of alternative control strategies

It consists to:

- Strengthen the exchange of information on the alternatives on pest management and their benefit for environment, health and crop production;
- Make known to producers and other stakeholders, trough sensitization, risks and impacts related to use, storage, transport, distribution/ marketing, handling of chemical pesticide;
- Sensitize, educate and inform producer groups on the judicious use of pesticides (in cases where the use of pesticides is necessary. Class III and U pesticides being the only ones that can be used in the project);
- Sensitize producer groups on hazards and good hygiene practices in the use of pesticides;
- Raise public awareness of the protection of people vulnerable to pesticides;
- Actively involve civil society in information / education / communication on pesticide management.

Information and awareness-raising strategy for users and the general public

Awareness-raising should aim to popularize pests integrated management methods and even very effective traditional methods of fighting insect pests.

Indeed, information and awareness about environmental and health risks are very little advanced in the country. Long-term strategies and effective approaches are needed to inform and sensitize all stakeholders by focusing on the following areas of intervention:

- develop and disseminate tools box on the various risks in the use of pesticides and good practices of integrated pest and pesticides management as alternatives;

- sensitizing actors through radio and television debates for promoting integrated pest and pesticides management ;
- provide support to trade unions operating in the various sectors concerned to raise awareness among their members on the occupational risks associated with chemicals in their respective fields;
- support consumer associations in raising awareness among the general public;
- strengthen the training of rural supervisors and extend their activities through rural radio stations;
- set up a national commission and local standards committees in both agricultural and industrial production;
- get closer to the chemical safety committee on chemicals.

Information and awareness programs are essential to reduce the risk of pesticide disease and poisoning and ultimately lead to real change in behavior.

f) Good practices to be adopted during the pesticide management cycle in the extreme case of use of WHO class III and U pesticides

In the framework of the project, agronomic, cultural, mechanical and biological methods of integrated pest management will be used. If these measures prove ineffective in the face of the problem that persists, only WHO class III and U pesticides may be used. In this case, some of the best practices to be applied in the cycle of use of these pesticides of class III and U include: (i) transport and handling; (ii) storage; (iii) maintenance of the equipment to be used; (iv) preparation of the pesticide slurry; (v) application of the pesticide slurry; (vi) bottom of vats or containers (or residue of slurry); (vii) management of packaging; (viii) termination of application.

g) Measures to be taken in cases of poisoning

In the project framework, agronomic, mechanical and biological methods are been promoted. When these measures are ineffective, the WHO Class III and U pesticides should be used. These Class III and U have little effect on human health in case of normal use. However, in case of poisoning appropriate care will be provided to the victims. If the situation is of concern, the victim will be evacuated to a health center in the area that has received training in pesticide poisoning management. A table showing some of the signs of intoxication and primary care to be provided before the evacuation of a victim, if necessary is prepared (refer to the PGIPP).

h) Monitoring and Evaluation

The monitoring plan is subordinate to the activities planned under the project. Monitoring is supported by the collection and analysis of data to verify whether the implementation of the activities is proceeding as planned and to make immediate adjustments if necessary. It is therefore a short-term evaluation activity to allow for real-time action. The frequency of monitoring will depend on the type of information required, however it will be continuous throughout the implementation of the project.

The overall monitoring will be ensured by the structures put in place for the implementation of the project. It will be organized through periodic field visits.

In order to do so, monitoring indicators have been established in relation to the above measures proposed in the implementation plan for the PGIPP.

In addition to the annual pest and pesticide management assessments that will allow continuous improvement of the implementation of the PGIPP, a mid-term evaluation will be conducted at the end of the second year of implementation and another at the end of the project.

i) Institutional arrangement for the PGIPP monitoring

In Guinea Bissau, three technical ministries are mainly concerned with the management of pests and pesticides:

- (i) the Ministry of Agriculture through the DPV, for pesticides used in agriculture;
- (ii) the Ministry of the Environment and Sustainable Development, which is responsible for all chemicals, including pesticides and the framing of measures of their impact on the environment; and
- (iii) the Ministry of Public Health, responsible for the treatment of cases of poisoning by pesticides including those used in public health).

In the framework of the present project, the monitoring of the integrated pest and pesticide management plan will be the responsibilities of the DPV and the AAAC. According to their attributions, the institutions below will support the DPV and AAAC:

- the Regional Directorates for Plant Protection;
- the National committee on pesticides management (CNGP);
- the Regional Directorates for Environment and Sustainable Development;

- the Regional Directorates of Agriculture;
- the Regional Directorates of Public Health;
- the representatives of the Governorate of the region
- the civil protection service;
- the National Laboratory for Agrarian Research (INPA);
- the representatives of NGOs.

The BOAD, the implementing entity will assess the implementation of the PGIPP measures through the periodic reports submitted by the PMU and its field verification missions. The Implementation Entity's annual report will include a section on the implementation of the PGIPP in the framework of the implementation of the Project Environmental and Social Management Plan. In addition to the annual pest and pesticide management assessments that will allow continuous improvement of the implementation of the PGIPP, a mid-term evaluation will be conducted at the end of the second year of implementation and another at the end of the project.

The different actions proposed in the integrated pest and pesticides management plan are integrated into the project components and their costs into the project budget.

I. INTRODUCTION

1.1. Contexte et justification du projet

La République de Guinée Bissau est un pays côtier d'Afrique de l'Ouest avec une superficie de 36 125 km² et une population estimée à 1,73 millions d'habitants. Situé à l'est de l'Océan Atlantique, elle borde le Sénégal au Nord et la République de Guinée à l'Est et au Sud, le pays est organisé en 8 régions administratives. La densité de la population est de 47,8 habitants par km² avec un taux annuel de croissance de la population est de 1,9%. Malgré la forte urbanisation au cours de ces dernières années, encore environ 58% de la population vit dans les zones rurales. Bissau, la capitale, abrite environ un quart de la population totale.

Les principales activités socio-économiques du pays concernent l'agriculture, la pêche, la sylviculture, l'élevage et l'extraction minière. L'agriculture comme secteur économique primaire de la Guinée Bissau est en grande partie basée sur l'agriculture de subsistance. Elle emploie 82% de la population active et génère 45% du PIB.

Cependant, cette agriculture est confrontée à d'énormes contraintes notamment d'ordre climatique et édaphique surtout dans les régions de l'Est de la Guinée Bissau. En effet, l'Est de la Guinée Bissau est une région aride qui est vulnérable au changement climatique et à la variabilité du climat. Cette zone connaît des événements climatiques extrêmes notamment les sécheresses. Les mécanismes d'adaptation développés par les agriculteurs familiaux dans certaines régions comme les régions de Gabú et Bafatá sont entre autres : le nomadisme temporaire, la réduction de la consommation alimentaire, la vente des actifs des ménages qui sont d'ailleurs rares, la migration vers les villes, etc. Ces mesures ne sont pas durables et plongent davantage les populations dans une situation de pauvreté, d'insécurité alimentaire, etc.

D'après, les résultats d'une récente enquête conduite sur la pauvreté dans le

pays dans le cadre du suivi des indicateurs de réduction de la pauvreté (ILAP2 2010)⁴, le taux de pauvreté globale de la population est à 69,3% contre 64,7% en 2002 (ILAP1). Le nombre de pauvres dans le pays est passé donc de 764 672 en 2002 à 1 014 277 personnes en 2010 soit une hausse de 24% le nombre de pauvre. Quant à l'extrême pauvreté, le taux est passé de 20,8% en 2002 à 33,0% en 2010 traduisant une nette détérioration de la situation dans le pays avec une dégradation des conditions de vie des ménages les plus pauvres et l'arrivée de « nouveaux pauvres ». Le phénomène est plus accentué en milieu rural.

Face à cette situation, le développement de l'agriculture résiliente au climat avec de techniques et pratiques de mobilisation et d'utilisation rationnelle d'eau à faible coût permettrait d'améliorer la production agricole et les moyens de subsistance des populations. C'est ainsi que le projet Scaling up climate change-smart agriculture in East Guinea Bissau, a été initié.

1.2. Objectif de l'étude

Bien que la zone ne soit reconnue comme étant potentiellement soumis à des attaques de parasites d'une importante ampleur, la mise en œuvre du projet fait appel au développement de techniques préventives et curatives de lutte contre les ennemis de cultures.

Les objectifs visés par le présent Plan de gestion intégrée des pestes et pesticides consistent à :

- Evaluer la capacité du cadre institutionnel et réglementaire à promouvoir et à mettre en œuvre une gestion sécuritaire, efficace et rationnelle des ennemis de cultures et des pesticides et d'intégrer dans les composantes du projet les mesures requises pour le renforcement des capacités ;

⁴ Inquérito Ligeiro para Avaliação da Pobreza (ILAP)

- Définir les règles et techniques à adopter par les bénéficiaires du projet en matière de contrôle et de gestion des ennemis de cultures ;
- Renforcer les pratiques visant à réduire la dépendance aux pesticides chimiques;
- S'assurer que les effets négatifs et les risques potentiels pour la santé humaine et animale et de la pollution de l'environnement (eau, air, sols,...) soient minimisés.

1.3. Approche méthodologique

L'élaboration de ce Plan de Gestion Intégrée des Pestes et Pesticides découle, en premier lieu des informations recueillies au niveau de la zone d'intervention du projet par le biais des interviews et consultations des bénéficiaires et des services techniques du domaine de l'agriculture, de la protection des plantes (lutte antiparasitaire), de l'environnement, etc. Et en second lieu, ces informations de terrain ont été complétées par des recherches et analyses documentaires traitant la gestion des pestes et pesticides.

Les données de terrain ont été collectées lors des visites de sites potentiels et lors des consultations publiques dans le cadre du projet. Les données collectées ont été analysées et ont permis de faire un état des lieux de la gestion des pestes et pesticides. La dernière étape a consisté à la rédaction du rapport. La revue documentaire a consisté en l'exploitation de la documentation pouvant conduire à l'atteinte des objectifs fixés pour la présente étude. Il s'agit des rapports des études environnementales et sociales et des rapports de Plan de Plan de gestion des pesticides dans le domaine de l'agriculture irriguée, des textes réglementaires nationaux et les politiques de sauvegarde de la Banque Ouest Africaine de Développement matière , etc. Ces deux étapes se sont déroulées simultanément et ont permis de capitaliser les données récoltées sur le terrain, mais aussi de mettre à jour certaines données existantes.

II. CADRE INSTITUTIONNEL ET JURIDIQUE DE LA GESTION DES PESTES ET PESTICIDES EN GUINEE BISSAU

2.1. Cadre institutionnel de gestion des pesticides

La Guinée Bissau s'est bien doté d'un cadre institutionnel sur la question des pesticides. A l'échelon central, trois ministères techniques en sont concernés: le Ministère de l'Agriculture, pour les pesticides utilisés en agriculture; le Ministère de l'Environnement et du développement durable, qui est responsable de tous les produits chimiques y compris les pesticides et notamment le cadrage des mesures de leur impact sur l'environnement; le Ministère de la Santé Publique, responsable de l'utilisation des pesticides utilisés en santé publique (lutte contre le paludisme, l'élaboration de textes sur la réglementation des produits utilisés en traitement intra domiciliaire).

Le Ministère de l'Agriculture, à travers la Direction de la Protection des Végétaux (SDPV), est concerné à titre principal par la gestion des pesticides à usage agricole. Dans le domaine du contrôle des produits phytosanitaires, la SDPV s'appuie essentiellement sur les Services de contrôle phytosanitaire et de mise en quarantaine des produits et sur le Comité National de Gestion des Pesticides (CNGP).

- Les Services de la Direction de la Protection des Végétaux

Les services de la Direction de la Protection des Végétaux (DPV) sont chargés de contrôler les agréments professionnels et les produits phytopharmaceutiques importés et distribués. Le service de la DPV dispose d'antennes régionales à travers les neuf régions. Ces derniers assurent pour le compte de la DPV un contrôle phytosanitaire des pesticides utilisés dans la région. Les contrôles prioritaires sont le contrôle de l'étiquetage et de l'emballage qui, doivent être réalisés au niveau des magasins de stockage ou des points de distribution des produits (contrôle des formulations et de leur conformité aux étiquettes; contrôle des résidus

dans les produits agricoles surtout par rapport aux Limites Maximales de Résidus admises par la Commission du Codex Alimentation de la FAO et de l'OMS; contrôle des agréments des produits ou homologation). Les SDPV a aussi en charge la formation à l'utilisation des produits, mais aussi la gestion des stocks périmés et la réutilisation des emballages. Toutefois, faute de moyens matériels et de laboratoires spécialisés, la plupart de ces contrôles ne s'effectue pas.

- **Le Comité National de Gestion des Pesticides (CNGP)**

La vente des produits phytosanitaires à usage Agricole en Guinée Bissau est interdite sans autorisation préalable accordée par le Département du Développement Rural et de l'Agriculture. Afin de pallier aux problèmes liés à l'utilisation non contrôlée des pesticides et réduire les risques liés à l'utilisation de pesticides de mauvaise qualité il est mis en place un Comité National de Gestion des Pesticides (CNGP) en Guinée Bissau conformément à l'article 11 du Décret – Loi n° 7/2000 du 24 août 2000. Ce comité est formé des membres venant des structures tels que l'environnement, la santé, l'agriculture, les organisations d'agriculteurs, la douane⁵.

Le CNGP assure, entre autres : (i) la mise en œuvre et le suivi du respect des procédures et normes de contrôle de qualité des pesticides ; (ii) le contrôle post homologation des pesticides ; (iii) le contrôle de conformité des pesticides; (iv) le contrôle de la distribution et de l'utilisation des pesticides ; (v) le contrôle des Limites Maximales de Résidus (LMR) des produits d'importation destinés à la consommation locale ; (vi) le contrôle des professionnels de la filière des pesticides; (vii) la tenue du registre des opérateurs de la filière ; (viii) la tenue et l'actualisation des pesticides homologués ; (ix) la dénonciation des pesticides non homologués entrés dans le pays ; (x) le suivi en matière de toxicovigilance; (xi) le suivi des essais de pré-vulgarisation ; (x) le suivi de la mise en œuvre des conventions internationales relatives aux pesticides.

⁵ voir Réglementation Commune sur l'Homologation des Pesticides entre les Etats membres du CILSS.

Plusieurs structures interviennent au sein de ce comité (l'environnement, la santé, les organisations d'agriculteurs, la douane).

2.2. Cadre réglementaire

2.2.1. Réglementation régionale et Internationale

- Réglementation commune aux Etats membres du CILSS sur l'homologation des pesticides

La Réglementation commune aux Etats membres du CILSS sur l'homologation des pesticides a été adoptée initialement en 1992 par la résolution N° 7/27/CM/92 de la 27e session ordinaire du Conseil des Ministres du CILSS. Elle est devenue opérationnelle en 1994 avec la mise en place et l'opérationnalisation du Comité Sahélien des Pesticides (CSP). Suite aux multiples tentatives de ratifications par les Assemblées Nationales des différents Etats membres, la Réglementation commune a été, avec l'appui de la FAO, révisée en 1999 par la Résolution 8/34/CM/99 et ce pour tenir compte de divers développements dans les législations des pesticides dans les Etats membres, ainsi que des expériences dans les procédures d'homologation des pesticides acquises par le CSP depuis sa création.

Ce système commun d'homologation des pesticides était justifié par les raisons suivantes:

- Les conditions agronomiques, climatiques et écologiques sont similaires dans le Sahel, ce qui facilite l'harmonisation des essais et l'acceptation mutuelle des données;
- Les expertises techniques et scientifiques nécessaires pour l'homologation, limitées dans chaque pays, peuvent être mises en commun au profit de tous les pays;
- Le marché de pesticides est plus grand au niveau de l'ensemble des pays, ce qui augmente le pouvoir réglementaire,

notamment pour imposer des frais de dossier, de la structure commune d'homologation;

- Un « guichet unique » est créé pour déposer des demandes d'homologation, et une seule autorisation est valable dans l'ensemble des Etats membres du CILSS, ce qui facilite les procédures pour l'industrie des pesticides;
- Une autorisation unique pour la circulation des pesticides dans l'espace CILSS réduit le nombre de frontières où l'importation de pesticides doit être contrôlée;
- La prise de décision commune, sur le plan régional, réduit le risque d'être confronté aux conflits d'intérêt nationaux.

Le champ d'application de la Réglementation commune est « l'autorisation, la mise sur le marché, l'utilisation et le contrôle de matières actives et de produits formulés de pesticides dans les Etats membres ». Elle est également applicable à « la classification, l'étiquetage, le conditionnement et l'emballage des formulations de pesticides. »

La gestion des pesticides, comme précisée dans le document de la Réglementation commune, est basée sur un partage des responsabilités entre le niveau régional et le niveau national.

Les activités pré-homologation (expérimentation) et post-homologation (mise sur le marché, importation/exportation, utilisation, surveillance, information et destruction des produits périmés) sont menées par les structures nationales de recherche et de vulgarisation. Le niveau régional procède à l'évaluation des dossiers pour l'homologation.

- **Règlement C/REG.3/5/2008 portant sur l'harmonisation des règles régissant l'homologation des pesticides dans l'espace CEDEAO.**

Il porte sur l'harmonisation des règles régissant l'homologation des pesticides dans l'espace CEDEAO. Le but de cette réglementation commune est de :

- protéger les populations et l'environnement Ouest Africain contre les dangers potentiels de l'utilisation des pesticides ;

- faciliter le commerce intra et inter-états des pesticides, à travers la mise en place de règles et de principes acceptés de commun accord au niveau régional pour démanteler les barrières commerciales ;
- faciliter à un accès convenable et à temps des pesticides de qualité aux paysans ;
- contribuer à la création d'un climat propice à l'investissement privé dans l'industrie des pesticides, et ;
- promouvoir le partenariat public-privé.

Cette réglementation s'applique à toutes les activités impliquant l'expérimentation, aussi bien que l'autorisation, le commerce, l'utilisation et le contrôle des pesticides et bio-pesticides dans les états membres. La mise en œuvre du présent projet doit se faire dans le respect de ces textes.

2.2.2. Conventions internationales et régionales

La Guinée Bissau est partie prenante des conventions internationales et régionales ci-après, qui touchent plus ou moins aux aspects gestion des Pesticides, à savoir :

- Code de bonne conduite en matière de gestion des pesticides de la FAO
- Réglementation Commune sur l'Homologation des Pesticides aux Etats membre du CILSS en 1999;
- Convention de Stockholm sur les Polluants Organiques Persistants adoptée le 22 Mai 2001 à Stockholm, Suède ;
- Protocole de Montréal relatif à des substances qui appauvrissent la couche d'ozone, entrée en vigueur le 1er Janvier 1989 et ratifié par 183 pays ;
- Convention International pour la Protection des Végétaux "CIPV" ;
- Convention de Berne sur la conservation de la faune et de la flore sauvage Européennes et de leurs Habitats naturels ;
- Convention de Bonn sur les espèces migratrices de faune ;
- Convention de Ramsar sur les zones humides ;

- Convention de Bâle sur le contrôle des mouvements transfrontaliers des déchets dangereux et de leur élimination, conclue à Bâle, Suisse, le 22 Mars 1989 et entrée en vigueur en Mai 1992 ;
- Convention de Rotterdam sur la procédure de consentement préalable en connaissance de cause applicable à certains produits chimiques et pesticides dangereux qui fait l'objet d'un commerce International signé en 1999;
- Convention sur la diversité biologique adoptée au Sommet de la Terre de 1992 à Rio de Janeiro, Brésil ;
- Convention de Bamako sur l'interdiction d'importer des déchets dangereux et le contrôle de leurs mouvements transfrontaliers en Afrique, adoptée le 30 Janvier 1991.

Par rapport à la Gestion des Pesticides, toutes les conventions citées ci-dessus sont ratifiées, mais leur traduction dans la législation nationale n'est pas effective dans leur totalité.

Le tableau suivant indique les énoncées de quelques conventions :

Tableau 1 : Quelques conventions internationales applicables aux activités du projet.

Intitulé du texte	Dates de signature/entrée en vigueur	Date de signature et ratification par la Guinée Bissau	Textes
Convention sur la Diversité Biologique	Signée le 11 juin 1992 à Rio de Janeiro (Brésil), et entrée en vigueur le 24 mars 1994	27 octobre 1995	« Chaque partie contractante adopte des procédures permettant d'exiger l'évaluation des impacts sur l'environnement des projets qu'elle a proposés et qui sont susceptibles de nuire sensiblement à la diversité biologique en vue d'éviter et de réduire au minimum de tels effets et s'il y a lieu, permet au public de participer à ces procédures » article 141a-b. Ainsi, le projet doit prendre toutes les dispositions pour éviter la destruction des éléments de la biodiversité, surtout avec les traitements phytosanitaires.
Convention Cadre des Nations Unies sur les Changements Climatiques	Signée le 11 juin 1992 à Rio de Janeiro (Brésil), et entrée en vigueur le 24 mars 1994	27 octobre 1995	Cette convention précise à l'article 4, alinéa f, « que les parties signataires tiennent compte, dans la mesure du possible, des considérations liées aux changements climatiques dans leurs politiques et actions sociales, économiques et environnementales, et utilisent des méthodes appropriées, par exemple des études d'impacts, formulées et définies sur le plan national pour réduire au minimum les effets préjudiciables à l'économie, à la santé publique et à la qualité de l'environnement des projets ou mesures qu'elles

Intitulé du texte	Dates de signature/entrée en vigueur	Date de signature et ratification par la Guinée Bissau	Textes
			entreprennent en vue d'atténuer les changements climatiques ou de s'y adapter ».
Convention relative aux zones humides d'importance internationale particulièrement comme habitat des oiseaux d'eau, dite « convention RAMSAR ».	Adoptée le 02 février 1971 (IRAN) et entrée en vigueur le 21 décembre 1975	14 mai 1990	La Convention de RAMSAR vise à enrayer la dégradation et la perte de zones humides (par exemple les dallols), en reconnaissant les fonctions écologiques fondamentales de celles-ci ainsi que leur valeur économique, culturelle, scientifique et récréative. Ainsi, elle a protégé les zones humides d'importance internationale (dallols avec les interventions du PROJET dans la région de Dosso).
Convention Africaine sur la conservation de la Nature et des ressources Naturelles dite 'Convention d'Alger», remplacée par la Convention adoptée par la 2 ^{ème} Session Ordinaire de la Conférence de l'Union Africaine tenue à Maputo (Mozambique).	Signée le 15 sept. 1968 et entrée en vigueur le 09 octobre 1969, puis modifiée le 11 juillet 2003		En Afrique, la désertification et les changements climatiques sont des faits réels et perceptibles, et ont conduit à la prise de conscience des préoccupations environnementales et de la nécessité de la protection de l'environnement.
Convention sur la conservation des espèces migratrices appartenant à la faune sauvage dite "Convention de	Signée le 23 juin 1979 et entrée en vigueur le 1 ^{er} novembre 1983.	1 septembre 1995	Elle a pour objectifs de conserver les espèces migratrices sur la totalité des parcours qu'elles empruntent et de protéger certaines espèces migratrices menacées.

Intitulé du texte	Dates de signature/entrée en vigueur	Date de signature et ratification par la Guinée Bissau	Textes
Bonn", signée à Bonn (Allemagne)			
Convention de Stockholm sur la protection de la santé humaine et de l'environnement contre les Polluants Organiques Persistants (POPs)	Adoptée à Stockholm le 22 mai 2001, entrée en vigueur le 17 mai 2004		Elle a pour objectifs de protéger la santé humaine et l'environnement contre les Pollutions Organiques Persistants. Ainsi, le projet doit veiller à l'utilisation des produits homologués lors des traitements phytosanitaires.
Convention de Rotterdam	-		Elle offre aux pays un outil de choix pour réduire les risques liés à l'utilisation des pesticides.
Politique Commune d'Amélioration de l'Environnement (PCAE) de l'UEMOA	Adoptée le 17 janvier 2008		L'acte additionnel n°001/CCEG/UEMOA portant adoption de la PCAE, dispose à son article 6 énonce que la PCAE respecte entre autres, les principes directeurs suivants : la précaution, la prévention, l'information et la notification préalable et la réparation ou le pollueur-payeur ».

2.2.3. Réglementation nationale

- La loi de base sur l'environnement

La Loi organique sur l'environnement est un instrument législatif qui dispose comme principe général en son article 2 que : « Toute personne a droit à un environnement humain écologiquement équilibré et a le devoir de le défendre, et il est de la responsabilité de l'Etat, par le biais d'organismes qualifiés et en faisant appel à l'initiative populaire et communautaire, d'œuvrer pour l'amélioration de la qualité de la vie, soit au niveau individuel, soit au niveau collectif ».

La politique de l'environnement cherche à optimiser et à garantir la continuité dans l'utilisation des ressources naturelles, qualitativement et quantitativement, comme principe fondamental pour un développement durable.

Ces principes sont établis à partir d'un éventail de mesures (article 4) dont l'objectif est de fournir un cadre qui favorise la santé et le bien-être des personnes, le développement social et culturel des communautés, ainsi que l'amélioration de la qualité de vie.

Au plan des normes, la loi ne dispose pas les limites réglementaires environnementales, comme par exemple, la qualité du sol, la qualité de l'eau, et qui pourraient être applicables au projet.

- Décret – Loi n° 7/2000 du 24 aout qui définit un encadrement technique et scientifique de l'utilisation des produits phytopharmaceutiques

Ce décret – Loi constitue la législation en matière de produits phytosanitaires en République Bissau-Guinéenne. Il stipule en son Article 2: 1. qu'il est interdit d'importer, de fabriquer, de formuler, conditionner ou rénover, stocker, utiliser ou mettre sur le marché tous les produits de protection des plantes non approuvé ou non autorisé par CSP

A ce décret-loi s'ajoute :

- Les directives contenues dans la convention de Rotterdam qui permettent au pays de sélectionner les types de pesticides dont il autorise l'importation;
- Les directives contenues dans le code de bonne conduite pour la distribution et l'utilisation des Pesticides, de la FAO sont un appui à toute cette gamme de textes.

2.2.4. Politiques environnementale et sociale du Fonds d'Adaptation

La politique vise à faire en sorte que dans la poursuite de la mission du Fonds de lutter contre les effets néfastes et les risques posés par le changement climatique, les projets et programmes soutenus par le Fonds ne donnent pas lieu à des dommages environnementaux et sociaux inutiles.

La politique environnementale et sociale est fondamentale pour assurer que le Fonds ne soutient pas les projets / programmes qui nuisent inutilement à l'environnement, la santé publique ou les communautés vulnérables. Dans le cadre des responsabilités des entités d'exécution du projet / programme, toutes les entités d'exécution devront (i) disposer d'un système de gestion environnementale et sociale qui garantit que les risques environnementaux et sociaux sont identifiés et évalués le plus tôt possible à la conception du projet / programme, (ii) d'adopter des mesures pour éviter ou si l'évitement est impossible de minimiser ou d'atténuer ces risques lors de la mise en œuvre, et (iii) de surveiller et de faire des rapports sur l'état de mise en œuvre de ces mesures pendant et à la fin du projet.

Conformément à la Politique environnementale et sociale du Fonds d'Adaptation, en aucun cas, les fonds du Fonds d'adaptation peuvent être utilisés pour l'achat de pesticides contenant des ingrédients actifs ou des pesticides de classe I ou de classe II dont la composition ne peut être déterminée.

Le tableau suivant présente les différentes classes des pesticides en fonction des dangers qu'ils présentent.

Tableau: Classification OMS recommandée des pesticides

Classe		DL ₅₀ pour un rat (mg/kg de poids vif)			
		Voie orale		Voie cutanée	
		Solide	Liquide	Solide	liquide
Ia	Extrêmement dangereux	<5	<20	<10	<40
Ib	Très dangereux	5-50	20-200	10-100	40-400
II	Modérément dangereux	50-500	200-2000	100-1000	400-4000
III	Légèrement dangereux	>500	>2000	>1000	>4000
U	Sans danger en cas d'usage normal	>2000	>3000	-	-

III. DESCRIPTION DU PROJET ET ZONE D'INTERVENTION

3.1. Description des principales activités du projet

Le projet, tel que conçu, traitera des principales questions de vulnérabilités dans l'agriculture et de la gestion rationnelle des ressources en eau afin de contribuer au développement et à la résilience des besoins immédiats et à long terme des agriculteurs extrêmement vulnérables, avec un accent particulier sur les groupes extrêmement vulnérables notamment les femmes, les personnes âgées et les enfants.

En lien avec la vulnérabilité du pays et les besoins d'adaptation identifiés, trois objectifs spécifiques sont poursuivis dans le cadre de ce projet:

1. Développer les capacités techniques et institutionnelles du gouvernement et de la société civile (secteur privé, communautés locales, ONG, etc.) pour faire face à l'augmentation du risque climatique dans la planification de l'adaptation au changement climatique;
2. Améliorer la résilience des systèmes de production agricoles existantes et contribuer à la diversification de la production, y compris la mise en œuvre d'un système de contrôle et de gestion de l'eau pour réduire au minimum les risques de sécheresses intenses et les inondations;
3. Promouvoir la diffusion des connaissances, des leçons apprises sur l'agriculture intelligente au climat et de la planification de l'adaptation à d'autres régions de la Guinée Bissau, à d'autres pays d'Afrique de l'Ouest.

Ces objectifs s'inscrivent en droite ligne de ceux énoncés par le Fonds d'Adaptation visant à "Réduire la vulnérabilité et accroître la capacité d'adaptation pour répondre aux impacts du changement climatique, y compris la variabilité au niveau local et national".

Le projet s'intègre également dans les documents de politique, stratégie et plan relatifs au développement de l'agriculture en Guinée Bissau, à la réduction de la pauvreté, au renforcement de la sécurité alimentaire et les capacités des populations à mieux s'adapter au changement climatique. Le projet s'intègre également dans la vision de développement 2035 de la Guinée Bissau.

Pour atteindre les objectifs ci-dessus, le projet a été structuré en trois composantes à savoir :

- Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification
- Accroissement de la résilience des systèmes productifs agricoles existants, y compris les mesures de contrôle et de gestion de l'eau
- Gestion de la connaissance et des leçons apprises sur l'agriculture intelligente

Au-delà de ces trois composantes de base, le projet comporte une composante relative à la gestion et coordination du projet.

Pour atteindre les objectifs ci-dessus, le projet a été structuré en trois composantes à savoir :

- Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification
- Accroissement de la résilience des systèmes productifs agricoles existants, y compris les mesures de contrôle et de gestion de l'eau
- Gestion de la connaissance et des leçons apprises sur l'agriculture intelligente

Au-delà de ces trois composantes de base, le comporte une composante relative à la gestion et coordination du projet.

Pour chacune desdites composantes, les activités ont été planifiées afin d'atteindre les objectifs poursuivis par le projet.

Composante 1. Développement des capacités techniques et institutionnelles pour répondre aux risques climatiques dans les pratiques d'adaptation et de la planification

Le projet propose un renforcement des capacités techniques et institutionnelles pour la planification des mesures d'adaptation au changement climatique. Cela comprendra le développement participatif des mesures d'adaptation agricole et de gestion de l'eau sur les sites et l'élaboration de plans d'intervention d'urgence (protection contre les inondations par exemple) pour la gestion des risques climatiques. Un autre accent sera mis sur le renforcement des interactions entre les acteurs concernés par l'adaptation au changement climatique: le gouvernement, les services météorologiques, le secteur de l'agriculture, des instituts de recherche, le gouvernement régional et national, ainsi que les médias et les communautés locales et autochtones.

Dans le but d'assurer une intégration parfaite des questions environnementales et sociales et le genre, le projet propose des actions de renforcement des capacités des acteurs impliqués dans la mise en œuvre du projet.

Il sera mis en place des brigades de feu qui bénéficieront des formations de renforcement de capacités dans la surveillance et la lutte contre les feux de brousse dans l'intérêt de préserver les formations forestières restantes et les plantations qui constituent des sources de revenus substantiels pour les populations.

Les résultats attendus et les activités planifiés sont:

Résultat 1.1 : Une évaluation de la vulnérabilité socio-climatique de l'Est de la Guinée-Bissau est conduite afin de sortir les réels besoins d'adaptation. Les activités envisagées sont :

- Évaluation des besoins en matière de capacité technique pour les ministères et les agents de terrain ;
- Plan d'intervention détaillé pour les actions pilotes d'agriculture intelligente en faveur du climat en Guinée-Bissau-Est.

Résultat 1.2 : Les groupes d'agriculteurs, les professionnels du développement et les experts gouvernementaux ont intégré des connaissances sur l'agriculture intelligente au climat, en pratique (sur place) et sur la planification de l'adaptation

- Formation technique pour les groupes cibles identifiés sur les pratiques agricoles
- Renforcement des capacités organisationnelles des agriculteurs
- Développement participatif d'actions d'adaptation agricole et de gestion de l'eau sur place
- Assistance technique et vulgarisation rurale pour les sous-projets
- Renforcement des capacités en matière de gestion des S & S et d'intégration de la dimension de genre
- Renforcement des capacités des brigades de pompiers pour prévenir les incendies de forêt
- Sensibilisation des populations locales à la gestion de la protection des forêts
- Renforcement des capacités des groupes de producteurs sur les bonnes pratiques et la gestion des pesticides et des pesticides
- Renforcement des capacités en matière de gestion des plans d'urgence.

Composante 2. Améliorer la résilience des systèmes de production agricole existants, y compris les mesures de contrôle et de gestion de l'eau

Cette composante vise à mettre en place les infrastructures de rétention des eaux pour assurer l'irrigation des cultures. Elle vise à accroître les productions et rendre disponible les produits alimentaires pour la consommation propre et éventuellement pour la commercialisation. Il s'agira de construire des seuils d'irrigation sur les sites identifiés. Des actions d'amélioration de la qualité du sol et de la protection des zones de mise en valeur contre l'ensablement seront entreprises.

Le projet apportera un appui technique dans le développement et la mise en valeur des sites à travers les services techniques du Ministère de l'agriculture et les autres institutions impliquées dans le projet.

Le projet réalisera au profit de la population des forages à motricité humaine dans les villages retenus pour améliorer l'alimentation en eau potable. A ces forages seront associés des abreuvoirs pour l'alimentation en eau du bétail.

Les résultats et activités spécifiques sont :

Résultat 2.1: Les activités agricoles sont intelligentes sur le plan du climat et contribuent à une augmentation durable de la productivité et renforcent la sécurité alimentaire nationale. Les activités sont :

- Construction de systèmes d'irrigation (digues, diguettes, bassin de rétention d'eau pluvial, forage, etc.) pour maintenir la production agricole en période de sécheresse
- Protection des sites contre l'érosion et l'ensablement à travers la mise en place des digues antiérosives et le reboisement des alentours des sites avec les arbres fruitiers adaptés
- Réhabilitation de la productivité des sols avant la mise en valeur des périmètres, y compris les investissements à petite échelle dans les machines et les outils de production

- Réalisation des forages d'eau à action humaine dans les villages bénéficiaires pour améliorer l'approvisionnement en eau domestique et pour le bétail

Composante 3. La gestion des connaissances des enseignements tirés de l'agriculture intelligente face au climat et à la planification de l'adaptation

Afin de garantir la visibilité des résultats du projet une stratégie de gestion des connaissances sera développée. Le produit de diffusion de base du projet sera un manuel de bonnes pratiques dans l'agriculture résiliente au changement climatique. Différentes versions du manuel seront produits, les deux sujets thématiques pertinents, techniques et non techniques, en portugais, en français et en anglais. Des informations sommaire sur feuilles / brochures / calendriers seront produites. Les manuels seront diffusés sur le site Web du projet et une suite d'ateliers au niveau national et provincial. En outre la diffusion aura lieu dans toute la région Afrique de l'Ouest grâce à des ateliers et à la diffusion de copies papier. L'équipe du projet sera en outre en interaction avec des médias nationaux (presse, internet, radio, etc.) pour rendre le public conscient des risques climatiques et des besoins d'adaptation.

Résultat 3.1: Des pratiques et une gestion agricoles intelligentes et respectueuses du climat sont adoptées dans des régions comparables du pays et diffusées dans d'autres pays d'Afrique de l'Ouest, contribuant ainsi à la résilience et aux besoins de développement dans ces régions. Les activités sont :

- Développement d'une stratégie de gestion des connaissances
- Création et animation d'un site web du projet pour la diffusion des informations
- Elaboration des manuels sur les meilleures pratiques agricoles et les mesures en faveur d'une agriculture respectueuse du climat

- Diffusion des résultats dans d'autres régions de la Guinée-Bissau, en Afrique de l'Ouest.

3.2. Zone d'intervention du projet

Le projet couvre les régions de Bafata et de Gabù. Ces deux régions forment l'Est Bissau-Guinéen. Les secteurs administratifs couverts par le projet sont les secteurs de Pitche, Pirada, Gabú, Sonaco, Contuboei et Ganadu.

Figure 1 : Carte de localisation de la zone d'intervention du projet

IV. ENNEMIS DE CULTURES ET PROBLEMES INDUITS

4.1. Ennemis de cultures

Les principaux ennemis des cultures vivrières (riz, maïs, etc.) et diverses plantes maraîchères (tomates, oseille, piment, gombo, etc.) sont connus et combattus avec usage de diverses techniques.

Dans plusieurs rapports de recherche agronomique, on peut noter que les conditions de climat tropical humides ou sèches avec des niveaux de températures suffisamment élevées favorables pour le développement de micro-organismes phyto-pathogènes.

Pour toutes les cultures prises globalement, de nombreux ennemis sont connus aux différents des taxons dont les dégâts sont susceptibles d'atteindre des seuils économiques. Nombreux phytophages qui s'attaquent principalement au riz sont :

Les Insectes et acariens :

- Nymphula Spp;
- Diopsis;
- Heteroninchus oryzae;
- Les ravageurs polyphages (pucerons-mouches blanches-criquets-termites) ;
- Sauteriaux;
- spodotera
- Les ravageurs avec plantes hôtes spécifiques (cochenilles farineuses (manguiers et Agrumes)

Les rongeurs et oiseaux

- Les rats au semis (arachide, niébé, maïs, riz) ; □ Les oiseaux au semis et à la maturité (riz).

Les mauvaises herbes :

- L'herbe de Laos (*chromolena odérata*) ;
- Les cypéracées ;
- Les euphorbiacées ;
- Les astéracées.

Les maladies

- *Pyricularia oryzae*
- *Helmithosporium oryzae*
- *Rhynchospodium oryzae*
- Fausse charbon

4.2. Pertes et dégâts causés par les ennemis de la culture

Les pertes et dégâts que ces ennemis de la culture occasionnent sur les cultures vivrières et les cultures maraichères traduisent généralement par la baisse de rendement, et par conséquent par la diminution de la production affectant la sécurité alimentaire et le bien être des producteurs.

4.3. Stratégies de lutte contre les ennemis de cultures

Pour combattre les différentes pestes, les principales stratégies généralement utilisées s'articulent autour de la lutte préventive, la lutte curative et la lutte culturale.

4.3.1. Lutte préventive

La lutte préventive est beaucoup plus utilisée dans le cadre de la lutte contre les insectes, avec des moyens matériels et humains, ainsi qu'un système de surveillance mis en place à cet effet. Quant aux autres pestes, elles sont généralement suivies par les producteurs eux-mêmes, les services déconcentrés de l'agriculture et de la protection des végétaux. Ce suivi local permet d'identifier précocement les pestes, les zones à risques d'infestation et de préparer conséquemment la lutte curative. Par ailleurs, il faudra signaler aussi le choix des variétés les plus résistantes, le traitement des semences comme méthodes de lutte préventive.

4.3.2. Lutte curative

Dans le cadre de la lutte curative, plusieurs méthodes sont utilisées:

- **Lutte chimique**

Elle constitue la méthode la plus employée. Sur les périmètres rizicoles et maraîchers, ils sont directement traités par les producteurs eux-mêmes aussi bien pour les semences, les ravageurs des fruits et légumes, les récoltes stockées, que pour les épandages des herbicides du riz. Malheureusement, ces producteurs ne maîtrisent ou ne respectent pas toujours les modes opératoires et ne portent généralement pas des mesures de protection lors des applications. Ce qui les expose à des risques sanitaires liés à ces produits.

- **Lutte biologique**

Elle consiste en la régulation des populations de ravageurs par l'introduction de leurs prédateurs et parasites dans le même milieu. Cette méthode n'est pas répandue en Guinée Bissau.

- **Lutte mécanique**

Elle concerne principalement la lutte contre les oiseaux granivores dans les périmètres rizicoles. Les méthodes les plus courantes sont :

- l'élagage des arbres pour empêcher les nidifications : cette méthode comporte des risques environnementaux liés au déboisement ;
- le dénichage.

- **Lutte agronomique ou culturale**

Plusieurs méthodes de lutte agronomique ou culturale sont recensées dans la zone du projet et concernent principalement le riz :

- Contre les oiseaux granivores : respect du calendrier cultural, notamment synchronisation des dates de repiquage pour limiter la période de maturation ;
- Contre les insectes : u.
- Contre la Panachure jaune et le flétrissement bactérien :
- Arrachage et brûlage des plants malades ;
- Arrachage des hôtes alternatifs (les riz sauvages, *Echinochloa stagnina* et d'autres graminées comme *Leersia hexandra*)
- Mise à sec des parcelles des riz, application de cendre et réduction de la dose d'urée ;
- Évitement de fortes densités ;
- Évitement des excès de la fertilisation azotée ;
- Utilisation de variétés tolérantes ou résistantes aux maladies.
- Etc.

V. UTILISATION ET GESTION DE PESTICIDES

5.1. Importation des pesticides

Les pesticides utilisés en agriculture sont en totalité importés par des firmes ou sociétés représentant les grandes industries agro-chimiques. Le circuit d'importation des pesticides en Guinée Bissau n'est pas encore bien maîtrisé. Il n'est donc pas possible de connaître la quantité totale de pesticides importés dans le pays. La situation géographique de la Guinée Bissau en fait un marché d'écoulement et d'utilisation et/ou de transit de divers produits aux caractéristiques souvent douteuses. Cette situation est favorisée par:

- la perméabilité des frontières (Sénégal, Guinée Conakry, Mali);
- la non disponibilité en tous lieux des pesticides homologués. ;
- l'ignorance par les populations de certains produits à base de matières actives extrêmement et hautement dangereuses;
- l'accessibilité à faible coût de ces produits en comparaison des pesticides homologués;

L'importation n'est pas encore maîtrisée par le Département du Développement Rural et de l'Agriculture de la Guinée Bissau. Les importations viennent principalement de la sous-région notamment du Sénégal, du Mali, ou de la Guinée Conakry voisin. Compte tenu des nombreuses larges et élastiques frontières, le circuit d'importation des pesticides n'est pas totalement maîtrisé pour connaître la quantité totale de pesticides en circulation dans le pays.

En effet, 87 produits sont autorisés par le CSP d'après la liste de janvier 2009 du Secrétariat Permanent du CSP à Bamako. Cependant, dans les faits beaucoup de produits non autorisés entre clandestinement dans le pays en provenance des pays limitrophes comme le Sénégal, la Guinée.

5.2. Organisation et pratique de la distribution et commercialisation

La distribution et la vente ne sont pas assumées par des revendeurs non agréés, mais on trouve sur le marché des vendeurs informels notamment dans les marchés hebdomadaires. Il est noté à travers le pays quelques revendeurs et d'étalagistes de pesticides dont la gestion pose problème aux services chargés de la réglementation et du contrôle. En effet, bon nombre d'entre eux ne répondent pas aux profils exigés par le métier. Dans les régions, il n'existe pas de magasins appropriés de stockage des pesticides.

Les Services de la Direction de la Protection des Végétaux (DPV) sont chargés du contrôle des distributeurs afin de s'assurer que seuls les produits homologués sont mis à la disposition des producteurs. Mais il faut souligner que leur nombre est relativement insuffisant pour couvrir le pays. L'insuffisance des points de vente officiels et les nombreux points de vente clandestins ne facilitent pas ce contrôle. On notera (i) les Postes de Police Phytosanitaires (postes fixes) aux points d'entrée et de sortie (postes frontières, ports, aéroports internationaux, service en charge des colis postaux) ; (ii) les services locaux de contrôle à l'intérieur du territoire (services itinérants).

5.3. Utilisation des pesticides

5.3.1. Au niveau de la Direction de la protection des végétaux/ institution publique

L'intervention de la DPV dans sa mission de promouvoir des mesures de lutte contre les organismes nuisibles se traduit pas la coordination, l'expertise et l'appui technique en matière de protection des végétaux et du phytosanitaire. Cependant, elle peut intervenir directement sur terrain dans le cas de fléaux ou d'une grande infestation des ennemis de la culture en

organisant la lutte (appui technique) et autant que possible en appliquant les mesures phytosanitaires adéquates (recherche de solutions alternatives et écologiques).

5.3.2. Au niveau des producteurs

Au niveau des producteurs, le degré d'utilisation des pesticides varie suivant les types de cultures et l'intensification culturale. Les cultures de riz ne font pas généralement appel à une utilisation de quantités importantes de pesticides dans la zone du projet. L'utilisation des pesticides dépend aussi des capacités financière des producteurs. Les producteurs qui disposent d'un peu de moyens s'approvisionnent de pesticides de qualité et homologués.

Dans la lutte chimique, les agricultures font recours à divers produits. Parmi ces produits, on peut citer: Endo sulfan-DDT; Endo sulfan-DDTméthylparathion ; Aldrin-DDT ; Poly chloro camphène-DDT-méthylparathion. La facilité d'accès aux pesticides, parfois même des pesticides prohibés notamment certains organochlorés (DDT, Dieldrine, Endosulfan, Endrine, etc.) est due à la multiplicité des points de vente de produits phytosanitaires mais aussi et surtout, du manque de contrôle de l'usage et de la commercialisation de ces substances. Ces produits sont dans la plupart des cas des produits à risques ou interdits.

5.3.3. Stockage des pesticides au niveau des paysans

Au niveau des populations, le système de stockage à domicile n'est pas souvent conforme et présente des risques majeurs. En effet il peut arriver que les produits soient stockés dans les chambres, au niveau d'un coin de l'habitation, dans des contenants non identifiés avec tous les risques inhérents à cette pratique notamment l'utilisation pour des fins d'alimentation par les enfants et aussi les adultes.

5.3.4. Application des pesticides

Ces pesticides sont parfois utilisés à tort et à travers, par les agriculteurs mais aussi par des applicateurs informels, surtout dans le maraîchage. Les produits sont même utilisés à des fins médicamenteuses (traitement de poux). Dans la plupart des cas, les agriculteurs effectuent les opérations sans équipement de protection adaptés (masques, gants, tenues, etc.).

5.3.5. Gestion des emballages vides et des obsolètes

Les emballages vides de pesticides sont utilisés pour stocker, conserver et transporter des boissons (dont l'eau, le vin de palme, du vin d'acajou, l'huile de palme, le lait, etc.) ainsi que des aliments tels que les bouillies et l'huile.

Il n'existe pas de système de gestion et d'élimination des emballages vides et des obsolètes de produits phytosanitaires en Guinée Bissau. En général, ces emballages vides sont réutilisés par les agriculteurs avec tous les risques sanitaires que cela comporte, soit ils sont rejetés dans la nature d'une manière anarchique, soit ils sont enfouis ou brûlés sur place.

5.4. Contraintes liées la gestion des pesticides

Les problèmes et contraintes suivantes ont été identifiés dans le cadre de la gestion actuelle des pesticides:

Au plan institutionnel, législatif et réglementaire

- Insuffisance des agents techniques auprès des producteurs ;
- Insuffisante de l'organisation des producteurs pour l'acquisition des produits ;
- Insuffisance de l'application des textes relatifs à la gestion des pesticides ;

- Insuffisance de la diffusion des textes juridiques en matière de gestion des pesticides ;
- Insuffisance de la diffusion des résultats de la recherche.

Au plan des capacités des acteurs et de la conscientisation des populations

- Insuffisance de la formation des producteurs agricoles sur l'usage des pesticides ;
- Insuffisance de l'information des populations sur la gestion sécuritaire des pesticides;
- Manque de contrôle de la qualité des pesticides et de la recherche des résidus dans les eaux, les sols et les aliments par la DPV et l'AAAC ;
- Coûts élevés des pesticides homologués par rapport aux pesticides fraudés.

Au plan de la gestion technique des pesticides

- Introduction de pesticides frauduleux, toxiques et de qualité douteuse ;
- Insuffisance/inadéquation d'infrastructures de stockage des produits;
- Insuffisance des agents techniques auprès des producteurs
- Insuffisance de contrôle, par les agents compétents, des pesticides vendus par les revendeurs et ceux utilisés par les producteurs ;
- Difficultés de retrait des pesticides non homologués et vendus sur le marché ;
- Insuffisance de la diffusion des méthodes alternatives aux pesticides et de lutte intégrée;
- Absence de collecte et de traitement des flacons ou contenants vides de pesticides ;
- Insuffisance de systèmes d'élimination des déchets.

Au plan des méthodes de lutte intégrée

- Insuffisance des expérimentations/ démonstrations, au niveau paysan, sur les méthodes de lutte alternatives aux pesticides ;

- Insuffisance d'agents formés en gestion intégrée des pestes et pesticides des cultures ;
- Insuffisance de la mise en œuvre des méthodes alternatives en lutte contre les déprédateurs.

Au plan de suivi et contrôle

- Absence d'analyse des résidus de pesticides dans les sols et dans les eaux;
- Absence de structure et de système de collecte et de gestion des emballages vides ;
- Absence de protection spécifique des canaux secondaire et tertiaire qui traversent les champs ;
- Insuffisance de techniciens spécialisés en évaluation environnementale et en suivi évaluation.

5.5. Impacts négatifs de l'utilisation non contrôlée des pesticides

Si les pesticides permettent de détruire les insectes, rongeurs, mauvaises herbes ou champignons qui peuvent se révéler indésirables pour l'agriculture, ils provoquent d'autre part des pollutions graves de l'environnement, qui ont des conséquences sur la santé humaine.

En effet, les pesticides se disséminent dans l'atmosphère lorsqu'ils sont appliqués, ou parce qu'ils s'envolent lorsqu'ils sont répandus. Ils retombent avec la pluie dans la terre, les plans d'eau, les rivières et sont drainés par les ruissellements et les infiltrations jusque dans les nappes phréatiques et les cours d'eaux souterraines.

La mauvaise application des pesticides, leur stockage sans précaution, les rejets de résidus sont responsables d'une contamination importante. Une pollution diffuse des cours d'eau, eaux souterraines existe aujourd'hui : il

devient difficile voire impossible d'assainir, et de rendre consommable pour l'homme.

Les pesticides ont des effets graves sur la santé humaine, qui varient en fonction de l'exposition, des doses : atteintes dermatologiques, neurologiques, du système cardio-vasculaire, du système respiratoire, maladies neurodégénératives, cancers...

Lorsqu'un organisme est exposé vis-à-vis d'un pesticide, il survient un effet qui est la manifestation de la toxicité du pesticide. Les toxiques produisent des effets au niveau de l'organisme à partir du moment où ils ont été absorbés, principalement au niveau de la peau, du tube digestif et des poumons ; les effets des produits toxiques sur l'organisme sont liés à leur concentration dans les organes cibles. Dans le cadre de l'emploi des pesticides comme mentionné dans la section précédente, les risques prévisibles sont liés aux étapes suivantes :

- stockage des produits ;
- manutention ;
- transport ;
- dosage lors des traitements particulièrement contamination des agents terrain (applicateurs) qui pourraient être exposés aux effets des pesticides si les consignes relatives aux normes d'utilisation des produits ne sont pas suffisamment appliquées ;
- etc.

Les principaux impacts/risques sur les milieux biophysique et humain, dans le cas où des pesticides traditionnels devraient être employés restent les suivants :

5.5.1. Impacts sur le milieu biophysique

Les composantes biophysiques les plus affectées sont entre autres le sol, l'eau, la faune, la flore.

- *Impacts sur les sols*

Le projet va induire l'utilisation ou l'augmentation de l'utilisation des pesticides dans les zones d'intervention. Ce qui aura des impacts négatifs potentiels sur les sols au niveau de la zone concernée.

En effet, pour accroître les rendements des cultures irriguées, la lutte contre les ennemis des cultures est une condition nécessaire et indispensable. Etant donné que c'est la lutte chimique qui est de loin la plus utilisée, l'usage des pesticides est susceptible de provoquer la modification de la composition des sols donc leur contamination surtout si l'application n'est pas faite dans les normes. Il y a risque d'acidification des sols en cas de mauvaise utilisation des pesticides.

Aussi, si les restes des pesticides ne sont pas bien gérés après l'application du traitement, ils contribueront à favoriser la contamination et la pollution des sols tout comme le déversement accidentel. Cet impact sur les sols pourrait avoir des incidences négatives potentielles sur les rendements des cultures qui constituent pourtant la finalité visée à travers l'utilisation de ces produits. Ceci justifie la nécessité de mettre en application les mesures que proposera le présent Plan de gestion des pesticides.

- *Impacts sur les ressources en eau*

L'utilisation des pesticides et autres produits chimiques pour lutter contre les ennemis des cultures aura des impacts négatifs potentiels sur les ressources en eau de surface et souterraine par ruissellement, lixiviation, lessivage et infiltration.

Pour ce qui concerne les eaux de surface, la principale menace est la pollution chimique. En effet, les pesticides utilisés peuvent se retrouver dans les eaux et les contaminer. Les principaux facteurs sont le ruissellement, le transfert et les vents. Une fois qu'ils s'y trouvent, ces pesticides peuvent altérer le PH et perturber l'équilibre écologique. Ainsi, les organismes vivants dans ces eaux tels

que les poissons et les autres microorganismes ne sont pas épargnés dans la mesure où ils peuvent être intoxiqués. On peut donc assister à une mortalité importante.

L'infiltration constitue la principale voie de contact entre les eaux et les pesticides. Par ce processus, les sources d'approvisionnement en eau de boisson que sont les retenues d'eau, les rivières, etc. peuvent être contaminées et devenir ainsi un problème de santé pour les populations.

- *Impacts sur la qualité de l'air*

L'utilisation des pesticides comporte des effets sur la qualité de l'air. Leur application sera source de contamination de l'air et engendra des nuisances olfactives.

- *Impacts sur la faune*

La faune sera affectée par les pesticides dans le cadre de la lutte antiparasitaire. En effet, la plupart des pesticides utilisés dans la lutte antiparasitaire peuvent toucher non seulement les ravageurs pour lesquels ils sont appliqués mais aussi « la faune non cible » à cause notamment de la non sélectivité de certains d'entre eux. Il faut noter également que les animaux peuvent être intoxiqués à travers les prises d'eau polluée par les pesticides. Les principaux mécanismes de l'intoxication chez cette dernière peuvent être :

- l'exposition pendant l'application surtout si elle est effectuée en période des conditions météorologiques défavorables (exemple : périodes de vents forts). En effet, lors du traitement des cultures par des pesticides, une proportion non négligeable de produit se trouve disséminée dans l'environnement, et ceci au-delà même du site traité.
- la consommation par les animaux, des pâturages récemment traités ;
- l'utilisation des contenants vides pour l'abreuvement des animaux.

Cette intoxication peut se traduire par des avortements chez les femelles en gestation. Elle peut également conduire à la perte des animaux.

On notera également des impacts tels que le développement d'autres formes de parasitisme, les accidents génétiques, la baisse de la productivité

- *Impacts sur la flore*

L'application non contrôlée des pesticides va occasionner des impacts négatifs sur la population végétale. Ces impacts sont entre autres :

- la réduction des effectifs et/ou des biomasses
- la disparition d'espèces ou de groupes d'espèces
- l'érosion et la perte de la biodiversité

Ces impacts sur la flore et la faune vont finalement induire à la rupture de l'équilibre écologique du milieu.

5.5.2. Impacts sur le milieu humain (santé humaine)

L'exposition aux pesticides peut être directe (contact lors de l'application, passage sur un site traité) ou indirecte ou secondaire (par l'eau, par l'alimentation...) et est susceptible de concerner dans ce cas l'ensemble de la population.

Les risques (définis comme l'existence d'une probabilité de voir un danger se concrétiser dans un ou plusieurs scénarios associée à des conséquences dommageables sur des personnes) d'exposition ponctuelle ou prolongée, pouvant provoquer des intoxications aiguës ou chroniques, augmentent dans le cas présent lors de l'application (manipulation du pulvérisateur ...), d'un contact avec les végétaux traités ou d'un problème technique.

Ainsi, les risques varient en fonction non seulement du profil toxicologique du produit (danger du produit) mais aussi de la nature des expositions et de leurs intensités.

Ponctuellement, l'intoxication aiguë provoque des irritations, des lésions (yeux, peau), des brûlures, des intoxications, de l'asthme, des évanouissements, et ce, en cas d'accident mais également en cas de mauvaise manipulation. De manière prolongée, l'intoxication, due à une exposition à de petites doses répétées dans le temps, peut être la cause d'effets graves pour les organes (cancers, maladies neurologiques, baisse de la fertilité, ...).

Ainsi, l'un des impacts négatifs le plus significatif des pesticides sur l'homme concerne l'intoxication. En effet, le recours à ces produits pour lutter contre les ennemis des cultures pour accroître la production agricole peut être source d'intoxication des populations pouvant souvent entraîner la mort. Les principales voies de contact entre l'homme et les pesticides qui peuvent être à l'origine de cette intoxication sont :

- la voie cutanée lorsque les pesticides sont manipulés sans gants, lorsque le liquide est renversé sur les vêtements ou quand le mélange des pesticides se fait avec la main ;
- la voie respiratoire ou l'inhalation concerne l'exposition aux vapeurs des produits concentrés lors de la préparation de la bouillie, l'exposition sans équipements de protection appropriés lors de la pulvérisation ;
- la consommation des produits agricoles traités dont le délai de rémanence n'est pas respecté ;
- la voie digestive lors du siphonage d'un tuyau avec la bouche ou lorsqu'on fume ou mange sans laver les mains après l'application des pesticides.

Il faudrait par ailleurs noter que si les sources d'approvisionnement en eau de boisson sont contaminées, la consommation de cette eau peut à long terme engendrer une bioaccumulation des pesticides chez les consommateurs et provoquer des maladies. Enfin, la consommation des produits contaminés (légumes) à la suite de traitement peut également être source de plusieurs maladies.

5.5.3. Impacts sur l'économie régionale ou locale

Il est évident que si la santé des acteurs est détériorée, cela aura des impacts négatifs aussi bien sur les économies locale, régionale que nationale. En effet, non seulement les jours de travail vont diminuer mais les dépenses liées aux soins vont augmenter, mettant ainsi en péril la vie des familles impactées.

Les impacts négatifs liés à l'utilisation des pesticides sont résumés dans le tableau suivant.

Tableau 2 : Impacts négatifs de l'utilisation non contrôlée des pesticides.

Milieu	Nature de l'impact
Sol	<ul style="list-style-type: none"> - Baisse de la Fertilité - Acidification - Alcanisation - salinisation
Eau	<ul style="list-style-type: none"> - perte de la qualité (contamination) - modification du PH
Air	<ul style="list-style-type: none"> - Contamination de l'air - Nuisances olfactives
Biodiversité (faune et flore)	<ul style="list-style-type: none"> - Chimiorésistance des ravageurs - Intoxication de la faune - Empoisonnement et mortalité - Réduction des effectifs et/ou des biomasses - Disparition d'espèces ou de groupes d'espèces - Rupture de l'équilibre écologique - érosion de la biodiversité - perte des espèces utiles
Santé humaine	<ul style="list-style-type: none"> - Intoxications aiguës <ul style="list-style-type: none"> o maux de tête, vertiges, nausées, douleurs thoraciques, vomissements, o éruptions, cutanées, douleurs musculaires, transpiration, excessive, crampes, o diarrhée et difficultés respiratoires, coloration et chute des ongles, Empoisonnement, Décès - Intoxications chroniques : <ul style="list-style-type: none"> o Baisse du taux de cholinestérase, o Effets sur le système nerveux (neurotoxines), o Effets sur le foie et l'estomac o Baisse du système immunitaire o Perturbation de l'équilibre hormonale (cerveau, thyroïde, parathyroïdes, reins, surrénale, testicules et ovaires)

	<ul style="list-style-type: none"> ○ Risque d'avortement (embryotoxines) ○ Mortalité à la naissance (foetotoxines) ○ Stérilité chez l'homme (spermatotoxines).
--	---

5.6. Risques et effets des pesticides

5.6.1. Identification des populations exposées aux risques liées à l'utilisation des pesticides

Les risques ont lieu pendant le transport, le stockage, la manipulation (préparation de la bouillie), l'application. Les personnes exposées sont :

- *les agents de terrain*

Ce sont les personnes impliquées dans les opérations de traitement qui sont les plus exposées mais, il est important de signaler que tous les autres agents peuvent être en danger.

- *les populations*

Les utilisateurs sont exposés aux pesticides pendant les opérations de traitement et après les opérations, et l'utilisation sans décontamination préalables des récipients de pesticide vides. L'absence d'application des mesures d'hygiène et les bonnes pratiques liées à l'utilisation des pesticides les exposent dangereusement aux effets des pesticides.

L'emploi abusif des pesticides et les utilisations déviées entraînent des résidus dans les produits de récolte exposant ainsi dangereusement les consommateurs aux dangers de ces derniers. De même l'application des pesticides à proximité des sources d'eaux entraînent leur contamination par les eaux de ruissellement (pour les eaux de surface) et de lessivage/lixiviation pour les eaux souterraines exposant ainsi les consommateurs ces eaux aux effets néfastes des pesticides.

La situation est telle que les mesures de sécurité recommandées par les organisations internationales notamment l'OMS et la FAO ne sont pas respectées par les utilisateurs de pesticides. On note en générale, l'ignorance des effets indésirables des pesticides, l'absence d'Equipement de Protection individuelle (EPI) l'ignorance des voies de pénétration des toxines dans l'organisme ; manque d'hygiène (alimentation au cours des traitements); utilisation des emballages vides dans la chaîne alimentaire ; ignorance de l'influence des conditions météorologiques au cours des traitements.

A ces deux catégories de personnes exposées aux risques de pesticides, s'ajoutent la classe des enfants, les femmes et les personnes âgées :

- *Vulnérabilité des enfants*

Du fait de leur système immunitaire qui n'a pas atteint un développement complet comme celui des adultes, les enfants sont particulièrement vulnérables aux impacts de l'exposition aux pesticides. Aussi sont-ils exposés à travers l'allaitement maternel si leurs mères ont été victimes des intoxications dues aux pesticides.

- *Vulnérabilité des femmes*

Chez les femmes, plusieurs facteurs physiologiques, socioculturels et économiques sont à l'origine de leur vulnérabilité. Il s'agit entre autres de :

- la peau des femmes absorbe plus facilement les pesticides que celle des hommes ;
- l'abondance des matières grasses chez la femme: pesticides peuvent y résider plus longtemps que chez l'homme ;
- l'œstrogène (présente seulement chez les femmes) augmente les effets des pesticides sur le système nerveux ;
- Certaines activités liées à la récolte et au stockage incombent aux femmes » à la puce vulnérabilité des femmes.

- *Vulnérabilité des personnes âgées*

Les personnes âgées quant à elles constituent une couche fragile du fait de leur âge avancé entraînant la diminution de la capacité de défenses de leur organisme contre des attaques externes diverses (microbes, virus, produits dangereux,...).

5.6.2. Risques de gestion des pesticides

Des quantités de pesticides font peser des risques majeurs sur la santé des hommes, des femmes, des animaux et l'environnement. Les conditions de stockage de ces déchets toxiques sont souvent inadaptées. Les pesticides sont souvent stockés dans les chambres à coucher, dans les cases de cuisines, dans les vestibules, dans des magasins situés au milieu des habitations. Les personnes sont donc exposées à l'émission dans l'air de ces déchets dangereux, aux risques intoxication alimentaire, etc.

L'utilisation des emballages des pesticides comme contenant des denrées alimentaires, des intoxications alimentaires par inadvertance, utilisation des pesticides comme arme de chasse et de pêche, des suicides volontaires sont autant de situations qui peuvent engendrer des accidents d'intoxications dus aux pesticides.

Les risques liés à l'usage des pesticides sont résumés dans le tableau suivant selon les étapes.

Tableau 3 : Synthèse des risques liés à l'usage des pesticides.

Etape	Causes	Risques/Impacts		
		Santé publique	Environnement	Producteurs
Transport	Manque de formation Utilisation des véhicules non appropriés	Contamination de personnes	Déversement accidentel, pollution de la nappe par lixiviation	Inhalation de produit : vapeur, poussière, risque de contact avec la peau
Stockage	Insuffisance de structure de stockage Manque de structure de récupération des obsolètes Déficit de formation sur la gestion des pesticides	Contamination accidentelle Gêne, nuisance des populations à proximité	Contamination du sol, des eaux, de l'air	Contact avec la peau par renversement occasionné par l'exiguïté des lieux
Manutention manipulation	Déficit de formation et de sensibilisation	Contamination des sources d'eau par le lavage des contenants	contamination du sol par déversement accidentel ou intentionnel, pollution de la nappe	Inhalation vapeur, contact dermique par éclaboussure lors de préparation ou transvasement
Elimination des emballages	déficit d'information de sensibilisation Manques de structures appropriées pour l'élimination des emballages vides	Ingestion des produits par le biais de la réutilisation des contenants	Contamination de l'environnement	Contact dermique et appareil respiratoire Intoxication chronique du personnel et des riverains
Lavage des contenants	déficit de d'information de sensibilisation	Contact dermique, contamination des puits	Intoxication aigue des poissons et autres crustacées, pollution des puits et mares, nappes	Contact dermique

VI. INFORMATION ET PERCEPTION DE LA POPULATION

Dans le cadre de la préparation du projet, il a été mené plusieurs consultations publiques. Il a été mené des interviews et consultations publiques auprès des producteurs dans les zones d'intervention. Les objectifs de ces consultations ont consisté à savoir et à déterminer les niveaux de capacité des planteurs de cannes dans la gestion des pesticides (utilisation, manipulation, maîtrise de consigne de sécurité à l'usage de ces produits) et de recueillir des témoignages de cas d'existence d'intoxications, de dangers vécus ou de l'état de santé des planteurs ou un des membres de leur famille.

6.1. Consultation publique

La consultation publique a lieu dans les zones d'interventions avec les bénéficiaires et dans les ministères avec les agents techniques.

Cette consultation s'est déroulée en plusieurs phases:

- une première consultation a été menée lors de la préparation de la note conceptuelle du projet (PCN);
- une seconde consultation lors de l'étude sur les leçons apprises du projet LDCF en cours d'achèvement;
- une troisième lors de la préparation du Full Project; et
- Une quatrième lors de l'identification des sites potentiels du projet.

L'objectif est de rechercher les points de vue des bénéficiaires et de recueillir les informations de base pour permettre une meilleure conception du projet avec une implication particulière des groupes vulnérables, des aînés, des femmes et des jeunes.

L'objectif principal de cette approche de l'information, de la communication et de la participation des parties prenantes était de créer des échanges mutuellement bénéfiques, favorables à un dialogue ouvert visant à: (i) la propriété du projet par les bénéficiaires au stade de la préparation et de la planification; (ii) l'examen des préoccupations de toutes les parties prenantes, y compris les groupes vulnérables (femmes, jeunes, enfants, etc.) dans la conception et la mise en œuvre du projet; (iii) échanges sur le financement et la durabilité des actions du projet du point de vue environnementale, sociale et économique.

Au cours de la préparation du projet, une revue de la littérature a été réalisée. Des entretiens avec des personnes-ressources travaillant dans différents ministères et structures concernés ont été réalisés. Des visites sur le terrain (sites potentiels et sites en exploitation) et des entretiens avec les bénéficiaires ont été effectués. Cela a permis d'établir de manière participative les problèmes à résoudre, les types de solutions adaptées, etc.

Pour le cas spécifiques de la gestion des pestes et pesticides, les points de débat/échanges se portent sur les points suivants : perception sur l'utilisation des pesticides ; la maîtrise de l'utilisation des pesticides ; la manipulation des produits et des matériels de traitement ; les types de formation reçus sur les pesticides et leur utilisation ; les risques encourus et les préjudices physiques ou séquelles sur la santé des utilisateurs ; les menaces sur l'environnement et sur les éléments biotiques qui y existent.

Les résultats des discussions organisées se résument comme suit :

- les producteurs n'utilisent des intrants chimiques agricoles et plus particulièrement des pesticides occasionnellement lorsqu'aucune alternative ne s'offre notamment pour ce qui concerne la lutte contre les ennemis de culture ;
- Les menaces de ravageurs au niveau des cultures sont tolérables et ne provoquent pas de diminution perceptible de rendement ;

- l'encadrement des producteurs est assuré par des techniciens du Ministère de l'agriculture notamment les Directions régionaux de l'agriculture et les services de la Direction de la protection des végétaux sur le traitement phytosanitaire ;
- les producteurs achètent les pesticides auprès des revendeurs d'intrants ;
- les revendeurs fournissent les produits selon les demandes des producteurs et donnent des instructions sommaires sur leur utilisation ;
- les produits utilisés auparavant n'existent plus sur le marché actuel avec la législation en vigueur;
- l'offre de travail en main-d'œuvre est tellement inférieure à la demande des producteurs que ces derniers font parfois recours à l'utilisation des herbicides mais se heurtent au manque de moyens financiers.
- Aucun accident ni aucune maladie contractée dû à l'utilisation des pesticides n'a été observée par les producteurs.

6.2. Doléance et traitement des doléances

Plusieurs doléances ont été formulées par les bénéficiaires potentiels dans le cadre de la préparation de ce projet. Celles qui concerne la gestion des pestes et pesticides, doléances majeures qui ont été sorties des discussions avec les planteurs, elles se convergent sur deux points :

- Le problème d'accès aux pesticides qui se traduit par l'impossibilité pour les producteurs d'acquérir des pesticides homologué dont le prix reste élevé par rapport aux autres pesticides ;

- Les besoins des producteurs en encadrement technique et en formation sur l'utilisation des pesticides et le traitement phytosanitaire.

Pour venir à bout de ces préoccupations, le projet compte promouvoir la lutte intégrée des pestes avec des alternatives agronomiques, culturales, mécaniques, biologiques afin d'éviter le recours aux pesticides chimiques ou de réduire considérablement l'utilisation de ces derniers. Ainsi, le projet apportera un appui technique et des conseils aux producteurs à travers les agents de la Direction de la protection des végétaux qui seront formés en gestion intégrée des pestes et pesticides dans le cadre du projet. Les producteurs seront formés sur des méthodes de gestion durable et intégrée des pestes et pesticides. Un appui organisationnel est également prévu afin de mieux organiser les producteurs.

Les principales actions de lutte intégrée de pestes et pesticides dans le cadre du projet sont présentées dans le Plan d'action suivant.

VII. PLAN D'ACTION POUR LA GESTION INTEGREE DES PESTES ET PESTICIDES

Le plan d'action du PGIPP comprend : (i) l'approche de gestion intégrée des pestes et pesticides ; (ii) les principes d'intervention ; (iii) le renforcement du cadre législatif de gestion des pesticides ; (iv) le renforcement des capacités des acteurs à travers les formations ; (v) les sensibilisations en vue de la promotion de l'usage des stratégies alternatives de lutte ; (vi) les bonnes pratiques à adopter durant le cycle de gestion des pesticides ; (vii) les mesures à prendre en cas d'intoxication ; et (viii) le plan de suivi-évaluation.

7.1. Approche de gestion intégrée des pestes et pesticides dans le cadre du projet

La lutte intégrée contre les parasites (IPM) est concernée par une approche holistique des techniques de lutte antiparasitaire, visant à maintenir les applications des pesticides et d'autres interventions dans des limites économiquement justifiées tout en minimisant les risques (réels ou potentiels) pour la santé humaine ou l'environnement. La lutte contre les nuisibles naturels joue un rôle important dans l'IPM, et comprend des mesures directes et indirectes (voir le tableau ci-dessous). Le projet actuel sur l'agriculture intelligente pour le climat vise à réduire de manière significative l'application des pesticides chimiques directement, où de nombreuses activités - utilisation des cultures adaptées aux conditions locales, dépendance aux attentes de rendement appropriées, utilisation de variétés résistantes, densification optimale des cultivars, etc. - chevauchement avec protection indirecte des plantes.

L'option pour la promotion de la lutte intégrée contre les ravageurs et les pesticides dans le cadre du projet est faite pour éviter ou réduire considérablement l'utilisation de pesticides chimiques. En cas d'attaque parasitaire, les méthodes les moins dangereuses seront préférées. Les pesticides chimiques seront utilisés dans des cas extrêmes où des méthodes

moins dangereuses s'avéreront inefficaces. Dans ce cas, le choix de l'utilisation de pesticides chimiques sera effectué conformément aux recommandations du plan intégré de lutte antiparasitaire et pesticide. Étant donné que la Guinée-Bissau n'a pas une expérience soutenue dans la lutte intégrée contre les ravageurs et les pesticides, il est très important de tenir compte des expériences et des enseignements tirés de la FAO dans la gestion intégrée des ravageurs et des pesticides dans les pays subsahariens de l'Afrique. C'est pourquoi, les membres du comité national de gestion des pesticides et des pesticides (CNGP), les agents DPV, le PMU, les représentants des ONG chargés de la supervision des bénéficiaires sur les périmètres seront formés à la gestion intégrée des parasites et des pesticides Dans la zone du projet par un expert très expérimenté dans la gestion intégrée des pesticides et des pesticides de la FAO dans les pays subsahariens d'Afrique (voir l'élément d) ci-dessous). Cet expert sera recruté par l'UGP sous la supervision de l'Entité d'exécution.

À la fin des séances de formation, une boîte d'outils intégrés de lutte contre les ravageurs et les pesticides sera mise à la disposition des bénéficiaires, du DPV, de l'UGP, du CNGP et de la Direction régionale de l'agriculture pour des actions intégrées de lutte intégrée contre les ravageurs et les pesticides. Cette boîte d'outils préparée par l'Expert ayant des expériences de la FAO dans le cadre de la gestion intégrée des pestes et pesticides, indiquera les actions appropriées à entreprendre suivant les différents ravageurs. La boîte à outils indiquera également les pesticides de classe U et III de l'OMS que les bénéficiaires peuvent utiliser si les actions de lutte alternative s'avèrent inefficaces pour résoudre le problème.

L'approche suivante garantira une gestion coordonnée et durable des pestes et pesticides dans le cadre du projet :

Étape 1: Diffusion des alternatives de lutte antiparasitaire.

Les alternatives aux pesticides en tant que contrôle agronomique, culturel, mécanique et biologique seront diffusées pour une meilleure utilisation par les producteurs. Les semences résistantes seront également promues. Ces actions

seront intégrées au début des sites ou au développement des cultures afin de prévenir l'attaque par des ravageurs. La boîte d'outils intégrés de lutte contre les ravageurs et les pesticides élaborée à la suite de la formation par l'expert de la FAO sera mise à la disposition des bénéficiaires

Pour la gestion intégrée des pestes et des pesticides et d'autres activités durables dans le cadre du projet, le projet collaborera étroitement avec les bureaux régionaux (CILSS à Ouagadougou (Burkina Faso, AGRHYMET à Niamey (Niger), EMPRES-FAO (Prévention des principales poussées de parasites en Afrique de l'Ouest et du Nord-Ouest) impliqués dans le développement durable de l'agriculture

Aucune modélisation spécifique des préjugés, exemple : Via le niveau de blessure économique et les seuils d'action, l'épidémiologie et les modèles de prévision, est prévu pour ce projet. Si disponible, cela peut être entrepris en collaboration avec des projets tiers identifiés par le Consultant recruté pour renforcer les capacités en matière de lutte intégrée contre les ravageurs et les pesticides.

Étape 2: Lorsqu'une attaque de cultures par des parasites est observée sur un site, les bénéficiaires, sous le contrôle de l'animateur du site et du coordinateur régional du projet, feront recours aux alternatives appropriées adoptées dans les outils de gestion intégrée des pestes préparés avec l'appui de l'Expert en gestion intégrée des pestes pour lesquelles les bénéficiaires, les animateurs de sites et les coordinateurs régionaux du projet ont déjà reçu une formation. Ces alternatives seront appliquées dans un esprit de protection de l'environnement et de santé humaine. Le coordinateur régional du projet informera l'UGP des mesures adéquates prises sur le périmètre par les bénéficiaires pour mettre fin à l'attaque des ravageurs.

Étape 3: Dans les cas extrêmes, où les actions alternatives se révèlent inefficaces, la direction régionale de la DPV, qui a également reçu une formation de l'expert en gestion intégrée des pestes, conseillera l'UGP sur la nécessité d'achats limités de pesticides de classe III ou U de l'OMS. L'utilisation

des pesticides de classe III et U par les bénéficiaires se fera avec l'appui de l'UGP sous le contrôle de la DPV. Le Comité national de gestion des pesticides (CNGP)⁶ sera informé par le DPV et l'UGP informera la BOAD du processus suivi.

Les alternatives possibles pour la lutte chimique antiparasitaire qui peuvent être utilisées dans le cadre du projet sont présentées dans le tableau ci-dessous:

Protection indirecte des plantes	Suivi et prévision	Protection directe des plantes
<p>Utilisation optimale des ressources naturelles:</p> <ul style="list-style-type: none"> - Utiliser une culture adaptée aux conditions locales - S'appuyer sur les attentes de rendement appropriées - Utilisation de variétés résistantes - Gestion des mauvaises herbes avec une intensité de concurrence suffisante - Des mélanges adéquats de variétés et de cultures - Calendrier optimal de la période de semis - Formation sur les ravageurs et les pesticides appropriés, en particulier les options biologiques, et l'importance des zones de 	<ul style="list-style-type: none"> • Le suivi et la prévision de l'incidence des ravageurs seront effectués conformément au plan d'IPM du projet. • Aucune modélisation spécifique des préjugés, p. Via le niveau de blessure économique et les seuils d'action, l'épidémiologie et les modèles de prévision, est prévu pour ce projet. Si disponible, cela peut être entrepris en collaboration avec des projets tiers identifiés par le Consultant recruté pour renforcer les capacités en matière de lutte intégrée 	<p>Utilisation de méthodes sélectives de lutte antiparasitaire:</p> <ul style="list-style-type: none"> • Partout et chaque fois que cela est adéquat, dépend de la lutte biologique, des bio pesticides, etc. <p>Méthodes chimiques de lutte antiparasitaire, uniquement lorsque d'autres options échouent ou seront très probables:</p> <ul style="list-style-type: none"> • Préférence pour les pesticides les plus spécifiques et sélectifs (classe III et U

⁶ Pour pallier aux problèmes liés à l'utilisation non contrôlée des pesticides et réduire les risques liés à l'utilisation de pesticides de mauvaise qualité il est mis en place un Comité National de Gestion des Pesticides (CNGP) en Guinée Bissau conformément à l'article 11 du Décret – Loi n° 7/2000 du 24 août 2000. Ce comité est formé des membres venant des structures tels que l'environnement, la santé, l'agriculture, les organisations d'agriculteurs, la douane. Le CNGP assure, entre autres : (i) la mise en œuvre et le suivi du respect des procédures et normes de contrôle de qualité des pesticides ; (ii) le contrôle post homologation des pesticides ; (iii) le contrôle de conformité des pesticides; (iv) le contrôle de la distribution et de l'utilisation des pesticides ; (v) le contrôle des Limites Maximales de Résidus (LMR) des produits d'importation destinés à la consommation locale ; (vi) le contrôle des professionnels de la filière des pesticides; (vii) la tenue du registre des opérateurs de la filière ; (viii) la tenue et l'actualisation des pesticides homologués ; (ix) la dénonciation des pesticides non homologués entrés dans le pays ; (x) le suivi en matière de toxicovigilance; (xi) le suivi des essais de pré-vulgarisation ; (x) le suivi de la mise en œuvre des conventions internationales relatives aux pesticides. Plusieurs structures interviennent au sein de ce comité (l'environnement, la santé, les organisations d'agriculteurs, la douane).

<p>compensation écologique</p> <p>Utilisation des pratiques agricoles sans impact négatif sur les agro-écosystèmes:</p> <ul style="list-style-type: none"> - Absence d'apport excédentaire de nutriments (en particulier N); - Densité optimale de la culture et du feuillage pour faciliter la ventilation - Faible intensité du travail du sol / méthodes de culture et de production protégeant la fertilité des sols - Gestion des mauvaises herbes pour le contrôle de l'érosion - Conservation et protection de la biodiversité pour améliorer la biodiversité, réduisant ainsi l'incidence des ravageurs - Lorsqu'une protection et une augmentation adéquates des antagonistes biologiques bénéfiques. 	<p>contre les ravageurs et les pesticides</p>	<p>de l'OMS)</p> <ul style="list-style-type: none"> • Préférence pour les pesticides les moins nocifs et les moins toxiques (classe III et U de l'OMS)
--	---	---

7.2. Principes d'intervention

La gestion des pestes et pesticides dans le cadre du projet devrait porter sur les principes suivant:

- Précaution et attention ;
- Renforcement des capacités des acteurs sur la gestion intégrée des pestes et des pesticides ;

- Traçabilité des produits utilisés ;
- Coordination et coopération intersectorielle ;
- Information et gestion des données relatives à la gestion des pesticides ;
- Rationalisation et renforcement des structures de surveillance et prévention des risques ;
- Suivi et évaluation ;
- Contrôle de l'impact sanitaire et environnemental ;
- Effectivité de la participation de tous les acteurs concernés ;
- promotion de la lutte intégrée dans les systèmes de vulgarisation/information des producteurs.

Pour ce qui concerne la lutte intégrée, les 16 principes de base internationalement reconnus seront appliqués. Ces principes sont :

- Principe 1 : Obtenir et planter du matériel végétal de qualité
- Principe 2 : Choisir des sols fertiles et des lieux adaptés à la plantation
- Principe 3 : Adopter de bonnes pratiques en pépinière
- Principe 4 : Adopter les dispositifs et les dispositifs adéquats de plantation
- Principe 6 : Pratiquer la rotation des cultures
- Principe 7 : Adopter de bonnes pratiques de conservation du sol
- Principe 8 : Adopter les pratiques adéquates de gestion hydrique
- Principe 9 : Désherber régulièrement
- Principe 10 : Inspecter régulièrement les champs
- Principe 11 : Maintenir les champs parfaitement propres
- Principe 12 : Lutter efficacement contre les ravageurs et les maladies
- Principe 13 : Favoriser l'accroissement des populations d'ennemis naturels (auxiliaires)
- Principe 14 : Réduire au minimum l'application de pesticides chimiques
- Principe 15 : Adopter de bonnes pratiques de récolte

- Principe 16 : Adopter des dispositifs de stockage propres et de qualité.

Le détail de ces 16 principes est joint en annexe 3 du document.

7.3. Renforcement du cadre législatif de gestion des pesticides

Il s'agit de :

- Prendre des mesures incitatives pour encourager l'utilisation des méthodes de lutte agronomiques, culturales, mécaniques et biologiques des pestes pour limiter considérablement l'utilisation de pesticides chimiques ;
- Vulgariser la gestion intégrée des pesticides et des pesticides.

7.4. Renforcement des capacités techniques des acteurs à travers les formations

Le projet organisera des sessions de renforcement des capacités sur la gestion intégrée des ravageurs et des pesticides pour les acteurs impliqués dans le projet. Le renforcement des capacités sera axé sur les alternatives aux pesticides en tant que contrôle agronomique, culturel, mécanique et biologique. Il s'agit des techniques ou des mesures prises en compte dans le développement des cultures pour prévenir les ruptures de parasites et éviter ou réduire considérablement l'utilisation de pesticides chimiques (les alternatives à l'utilisation des pesticides chimiques sont présentées dans l'approche intégrée de gestion des pestes et pesticides présentée ci-dessous. Les activités de renforcement des capacités sur la gestion intégrée des pestes et pesticides concerneront au moins les institutions et individus suivants: les Directions régionales de la protection des végétaux, le Comité national de gestion des pesticides (CNGP), les Directions régionales de l'environnement et du développement durable, les Directions régionales de l'agriculture, les Directions régionales de la gestion des infrastructures hydrauliques de l'agriculture, représentant du gouvernorat de la région, Autorité compétente

pour l'évaluation environnementale (AAAC), les Directions régionales de la santé publique, le Laboratoire national de recherche agraire (INPA), les membres du comité de gestion des périmètres, les représentants des ONG chargés de la supervision des bénéficiaires sur les sites, l'UGP et les présidents des périmètres seront formés à la gestion intégrée des parasites et des pesticides.

Cette formation sera menée par un expert très expérimenté dans la gestion intégrée des pesticides et des pesticides de la FAO dans les pays subsahariens d'Afrique. Cet expert sera recruté par l'UGP sous la supervision de l'Entité d'exécution sur la base d'une liste restreinte d'experts recommandée par le bureau de la FAO basé à Rome (Italie) et en Afrique de l'Ouest à Accra (Ghana).

À la fin des séances de formation, une boîte d'outils intégrés de lutte contre les ravageurs et les pesticides sera mise à la disposition des bénéficiaires, du DPV, de l'UGP, du CNGP et de la Direction régionale de l'agriculture pour des actions intégrées de lutte intégrée contre les ravageurs et les pesticides.

Comme mentionné plus haut, pour la gestion intégrée des pestes et des pesticides et d'autres activités durables dans le cadre du projet, le projet collaborera étroitement avec les bureaux régionaux (CILSS à Ouagadougou (Burkina Faso, AGRHYMET à Niamey (Niger), EMPRES-FAO (Prévention des grands ravages dans Afrique de l'Ouest et du Nord-Ouest)) impliqués dans le développement durable de l'agriculture.

7.5. Sensibilisation des producteurs pour promouvoir les stratégies de lutte intégrée des pestes

Il consiste à :

- Renforcer l'échange d'information sur les alternatives de lutte intégrée des pestes et de leurs bénéfices pour l'environnement, la santé humaine et la production agricole ;

- Sensibiliser les groupements de producteurs sur les dangers et les bonnes pratiques d'hygiène en matière d'utilisation des pesticides ;
- Sensibiliser, éduquer et informer les groupements de producteurs sur l'utilisation judicieuse des pesticides ;
- Sensibiliser la population à la protection des personnes vulnérables aux pesticides ;
- Impliquer de manière active la société civile dans l'information/éducation/communication en matière de gestion des pesticides.

Stratégie d'information et sensibilisation des usagers et de la population

La sensibilisation devrait viser la vulgariser des méthodes de gestion intégrée et même des méthodes traditionnelles très efficaces ainsi que des méthodes naturelles de lutte contre les insectes nuisibles.

En effet, l'information et la sensibilisation aux risques environnementaux et sanitaires sont très peu avancées dans le pays. Des stratégies à long terme et des approches efficaces sont nécessaires pour informer et sensibiliser toutes les parties prenantes en mettant l'accent sur les axes d'intervention suivants:

- élaborer et diffuser des outils/documents sur les différents risques liés à l'utilisation des pesticides et les bonnes pratiques de gestion intégrée des pestes en tant que solutions de rechange;
- sensibiliser des acteurs à travers des émissions débats radiodiffusées et télévisées pour promouvoir la gestion intégrée des pestes et pesticides
- apporter un soutien aux syndicats opérant dans les différents secteurs concernés pour la sensibilisation de leurs membres sur les risques professionnels liés aux produits chimiques dans leur domaine respectifs.

7.6. Bonnes pratiques à adopter durant le cycle de gestion des pesticides dans les cas extrêmes d'utilisation des pesticides de classes III et U de l'OMS

Dans le cadre du projet, les méthodes agronomiques, culturales, mécaniques et biologiques de lutte intégrée contre les pestes seront utilisées. Au cas où, ces mesures se révèlent inefficaces face au problème qui persiste, seuls les pesticides de classe III et U de l'OMS peuvent être utilisés. Dans ce dernier cas, certaines des bonnes pratiques à appliquer dans le cycle d'utilisation de ces pesticides sont présentées dans le tableau suivant :

Tableau 4 : Mesures de bonnes pratiques.

Étape	Risques	Bonnes pratiques
Transport et manipulation	<ul style="list-style-type: none"> - Risque pour la santé. - Possible détérioration des emballages et de fuite et renversement des produits. - Risque de déversement sur le sol 	<ul style="list-style-type: none"> - Utiliser les équipements de protection ; - Utiliser des appareils mécaniques appropriés pour transporter et lever les produits ; - Bien arrimer les charges ; - Isoler les produits de l'habitacle ; - Posséder les documents autorisant le transport de produits dangereux. - Séparer les produits dangereux des autres.
Stockage	<ul style="list-style-type: none"> - Risque de contamination par ingestion, contact avec la peau ou les yeux pour le gestionnaire du local, des personnes extérieures ou des animaux. - Risque de pollution de l'environnement par déversement - Risque d'incendie 	<ul style="list-style-type: none"> - Stocker les produits dans un local réservé, ventilé et fermé à clé. - Conserver les produits dans leur emballage d'origine. - Réviser périodiquement les produits stockés pour s'assurer de leur bon état. - Pour l'approvisionnement, suivre la méthode des « premier entré = premier sorti ». - Ne pas laisser de matières combustibles dans le local (palette en bois, carton ...). - Identifier et isoler les produits non étiquetés dans le local et informer les services compétents

	<ul style="list-style-type: none"> - Risque de confondre deux produits qui ne sont pas destinés au même usage. 	<ul style="list-style-type: none"> - Identifier et isoler les produits classés CMR (Cancérogènes, Mutagènes et toxiques pour la Reproduction).
Entretien du matériel	<ul style="list-style-type: none"> - Risque mécanique - Risque de contamination si les équipements de protection ne sont pas portés - Risque de mauvais fonctionnement de l'appareil (ex : buses ou tuyaux bouchés) - Risque de pollution accidentelle. 	<ul style="list-style-type: none"> - Entretien des équipements afin qu'ils soient toujours propres et en parfait état. - Changer régulièrement les filtres - Contrôler périodiquement les conduits de distribution en caoutchouc et les buses. Les remplacer suivant les recommandations du fabricant. - Adapter le matériel au type de traitement. - Utiliser un clapet anti-retour afin d'éviter tout siphonage de la cuve. - Veiller à ce que les réglages soient corrects. - Réviser les équipements avant l'emploi pour surveiller la présence de fuite. - Ne pas utiliser d'équipements ayant des défauts de qualité ou des fuites.
Préparation de la bouillie	<ul style="list-style-type: none"> - Risque de pollution d'eau et de l'environnement. 	<ul style="list-style-type: none"> - Porter les équipements de protection individuelle. Les changer s'ils sont souillés ou usagés. - Bien lire les étiquettes et ne pas utiliser de produit non-étiqueté.

	<ul style="list-style-type: none"> - Risque pour la santé humaine, animale ou le matériel en cas de mauvais mélange. - Risque de chute si le remplissage se fait par le haut de la cuve. - Risque de confusion entre deux produits. 	<ul style="list-style-type: none"> - Surveiller le remplissage pour éviter tout débordement et utiliser des appareils évitant tout risque de pollution accidentelle (cuve intermédiaire, clapet anti-retour, volucompteur ...). - Faire le remplissage sur une aire prévue à cet effet et équipé d'une cuve de recueillement des eaux souillées. - Calculer les volumes à l'avance et ajuster les doses de produits. - Réserver uniquement à cet usage les outils utilisés (entonnoir, pot doseur, ...). - Rincer les bidons à 3 reprises puis les laisser égoutter et sécher.
Application de la bouillie	<ul style="list-style-type: none"> - Risque pour la santé. - Risque pour l'environnement. - Risque de phyto-toxicité 	<ul style="list-style-type: none"> - Porter les équipements de protection si le tracteur n'est pas équipé d'une cabine filtrée et climatisée et penser à changer les filtres régulièrement. - Tenir compte des conditions météorologiques (température, hygrométrie, vent). - Lors des fortes chaleurs, préférer un traitement aux premières heures ou aux dernières heures de la journée. - Tenir éloignés de la zone de traitement et des cultures traitées, les personnes et les animaux ne participant pas aux opérations. - Eviter au maximum le phénomène de dérive et bien choisir les buses d'application.

		<ul style="list-style-type: none"> - Ne pas traiter les bordures de cours d'eau Traiter en respectant la réglementation relative à la protection de la faune et en particulier des abeilles. - Respecter les doses d'épandage. - Rouler doucement en terrain irrégulier ou inconnu. - Terminer l'application par un rinçage de la cuve. - Prévoir des buses d'avance et des gants et/ou se munir d'une bombe d'air comprimé en cas de bouchage.
Fond des cuves ou récipients	<ul style="list-style-type: none"> - Risque de pollution des cours d'eau. - Risque pour la santé. 	<ul style="list-style-type: none"> - Diluer le fond de cuve au moins 3 fois avec de l'eau claire. - Epandre sur la parcelle en veillant à ne pas dépasser la dose maximale ou vidanger sur une aire de remplissage équipée d'un système de récupération. - Eliminer les restes de fond de cuve au moyen d'un équipement agréé par le ministère ou par un prestataire de service.
Gestion des emballages	<ul style="list-style-type: none"> - Risque de pollution pour l'environnement. - Risque pour la santé de l'utilisateur, des personnes extérieures et des animaux. 	<ul style="list-style-type: none"> - Ne pas déverser les restes sur la terre. - Rincer les bidons à 3 reprises, puis les laisser égoutter et sécher. - Ne jamais submerger ou introduire les récipients dans des canaux d'irrigation, cours d'eau ou lagune pour les laver. - Ne pas brûler les emballages vides.

		<ul style="list-style-type: none"> - Déposer les emballages vides dans des sacs spéciaux afin de les confier par la suite à des structures appropriées - Ne pas laisser des emballages vides sur la zone de traitement ou dans des endroits accessibles. - Identifier les produits non utilisés. Les isoler dans le local phytosanitaire en attendant leur collecte par des services spécialisés
Fin d'application	Risques de contamination diverses	<ul style="list-style-type: none"> - Laver les EPI réutilisables. - Se laver les mains avec de l'eau et du savon, prendre une douche à la fin du traitement et changer de vêtements. - Porter les équipements de protection pour le nettoyage des appareils de pulvérisation, des filtres. - Ne jamais souffler ou aspirer dans une buse. - Nettoyer l'appareil sur une aire prévue pour cet effet, qui peut être l'aire de remplissage. - Traiter l'eau de nettoyage comme un déchet dangereux.

7.7. Mesures à prendre en cas d'intoxication

Les pesticides de classe III et U OMS ont moins d'effet sur la santé humaine en cas d'utilisation normale. Toutefois, en cas d'intoxication, des soins appropriés seront apportés aux victimes. Si la situation se présente comme étant préoccupante, la victime sera évacuée vers un centre de santé de la région qui a reçu les formations nécessaires en matière de gestion des intoxications par des pesticides. Le tableau suivant indique certains des signes d'intoxication et les soins primaires à apporter avant l'évacuation d'une victime,» si nécessaire.

Tableau 5 : Signes d'intoxication et soins primaires

Signes d'intoxication	Soins primaires
Contamination des yeux - douleurs ou irritations	<ul style="list-style-type: none">- Rincer abondamment à l'eau du robinet- Si cela aggrave consulter un médecin
Irritation de la peau- sensations de picotement et brûlure	<ul style="list-style-type: none">- Laver la partie contaminée avec de l'eau, <i>jamais</i> avec de l'huile
Sensation de fatigue, maux de tête ou vertiges	<ul style="list-style-type: none">- Se reposer- Ne pas recommencer avant de se sentir totalement reposé
Inhalation du produit	<ul style="list-style-type: none">- Rester à l'ombre- Mettre sous surveillance médicale

7.8. Plan de suivi- Evaluation

Le plan de suivi est subordonné aux activités prévues dans le cadre du projet. Le Suivi est soutenu par la collecte et l'analyse de données pour vérifier si la mise en œuvre des activités se déroule comme prévu et pour procéder à des

adaptations immédiates, si nécessaires. Il s'agit donc d'une activité d'évaluation axée sur le court terme, afin de permettre d'agir à temps réel. La fréquence du suivi dépendra du type d'information nécessaire, cependant il sera continu tout le long de la mise en œuvre du projet.

Le suivi global sera assuré, par les structures mise en place pour la mise en œuvre du projet. Il sera organisé par le biais de visites périodiques sur le terrain. Un plan de suivi complet sera élaboré et mis à la disposition des acteurs impliqués dans la mise en œuvre et qui sont interpellés, chacun en ce qui le concerne, dans le suivi.

7.8.1. Indicateurs de suivi

Les indicateurs à suivre lors de la mise en œuvre aussi bien des activités de recherche que celles relatives à la vulgarisation agricole par les coordonnateurs régionaux, les vulgarisateurs agricoles, les services chargés de la protection des végétaux, des services environnementaux et des services sanitaires du pays sont les suivants :

a) Indicateurs d'ordre stratégique

Les indicateurs stratégiques à suivre sont les suivants:

- Tenue de réunion de partage et de dissémination du Plan de gestion intégrée des pestes et pesticides;
- Niveau d'articulation et de synergie du PGIPP avec stratégies nationales en cours/en vue ;
- Processus, étapes et critères environnementaux dans les activités ;
- Nombre d'acteurs formés/sensibilisés sur la gestion intégrée des pestes et pesticides;
- Effectivité du suivi environnemental national et du reporting.

b) Indicateurs liées au renforcement de capacités - Information/sensibilisation des populations à suivre par l'UGP

- Nombre de sessions de formation effectuées;

- Nombre d'agents formés;
- Nombre d'agriculteur adoptant les pratiques de lutte intégrée des pestes ;
- Pourcentage de la population touchée par les campagnes de sensibilisation sur les risques liés à l'utilisation des pestes et les avantages environnementaux et sociaux liés à l'usage des alternatives de lutte contre les pestes ;
- Niveau de connaissance des utilisateurs sur les produits et les risques associés.

c) Indicateurs à suivre par les coordonnateurs régionaux et autres structures de mise en œuvre du projet

Les indicateurs ci-dessous sont proposés pour être suivi par les coordonnateurs régionaux en collaborations avec les structures étatiques impliquées dans la mise en œuvre du projet :

- Niveau de réussite de l'application des alternatives de lutte intégrée
- Degré de toxicité des produits utilisés ;
- Quantité disponible des équipements de protection
- Niveau de connaissance des bonnes pratiques de gestion (pesticides, emballages vides, etc.)
- Niveau de maîtrise des procédés de pulvérisation et d'imprégnation en cas d'usage de pesticides (pesticides moins dangereux) ;
- Niveau d'impact sur les animaux domestiques, les organismes aquatiques et la faune
- Niveau des risques associés au transport et à l'entreposage ;
- Mode de gestion des emballages vides.

d) Indicateurs à suivre par d'autres institutions étatiques

Lors de la phase de mise en œuvre des activités du Plan de gestion des pesticides, le suivi va porter sur les principales composantes environnementales

(eau, sol, végétation et faune, cadre de vie, santé, etc.) et sera assuré par les structures étatiques ayant en charge la gestion de ces composantes (services forestiers, services hydrauliques, services sanitaires, etc.).

Tableau: récapitulatif du Plan de suivi

Composante	Éléments de suivi	Indicateurs et éléments à collecter	Périodicité	Responsables du suivi
Eaux	Etat de pollution / contamination des eaux)	- Paramètres physico-chimique et bactériologique des plans d'eau (résidus de pesticides, etc.)	Une fois par an	DPV AAAC
Sols	Etat de pollution des sites	- Typologie et quantité des rejets (solides et liquides)	Une fois par an	DPV DRA AAAC
Végétation et faune	Évolution de la faune et de la microfaune ; et l'état de la flore de la biodiversité animale et végétale	- Type de méthode utilisée pour la gestion des pestes - Niveaux de destruction des non cibles (animaux, faune aquatiques et végétation)	Une fois par an	DPV AAAC DGE ⁷
Environnement humain	Hygiène et santé Pollution Protection et Sécurité lors des opérations	- Types de méthodes utilisées - Nombre de producteurs formés sur les méthodes de lutte intégrée - Nombre d'accident/intoxication - Niveau du suivi effectué par les agents de la DPV	Une fois par semestre	DPV DRA AAAC

7.8.2. Arrangement institutionnel du suivi du PGIPP

Le suivi du Plan de gestion intégrée des pestes et pesticides est assuré par la DPV et l'AAAC. Ils seront appuyés par les institutions suivantes, chacune selon ses attributions :

- les Directions régionales de la protection des végétaux;
- le Comité nationale de gestion des pesticides ;
- les Directions régionales de l'environnement et du développement durable ;

⁷ Direction générale de l'environnement

- les Directions régionales de l'agriculture ;
- les Directions régionales de la santé publique ;
- le service de la protection civile ;
- le Laboratoire nationale de la recherche agraire (INPA) ;
- les représentants des ONG.

L'entité d'implémentation évaluera la mise en œuvre des mesures du PGIPP à travers les rapports périodiques qui lui seront soumis par l'UGP et ses missions de vérification sur le terrain. Le rapport annuel de l'entité d'implémentation comportera une rubrique sur la mise en œuvre du PGIPP dans le cadre de l'exécution du Plan de gestion environnementale et sociale du projet.

7.8.3. Évaluation

Deux évaluations seront effectuées dans le cadre du projet pour mesurer la performance du Plan de gestion des pestes et pesticides. Il s'agit de l'évaluation à mi-parcours et de l'évaluation finale. Toutefois des missions de suivi seront organisées à raison de deux missions par an pour mesurer l'efficacité des mesures proposer (formations, sensibilisation, mesures de bonnes gestion, etc.).

L'objet de l'évaluation sera de déterminer l'évolution correcte du plan de gestion, les résultats à mi-parcours. Les partenaires financiers, les bénéficiaires du projet et les autres partenaires impliqués participeront entièrement à l'évaluation du PGPP.

7.9. Coût des activités proposées dans le Plan d'action

Le cout de mise en œuvre des mesures contenues dans le plan d'action est présenté dans le tableau suivant.

Les différentes actions proposées sont intégrées dans les composantes du projet et leurs coûts dans le budget du projet.

Tableau 6 : Coût des activités.

Composantes	Résultats	Activités	Indicateurs	Responsable de mise en œuvre	Responsable de suivi	Coût (USD)
Renforcement du cadre législatif de gestion des pesticides	Les textes réglementaires sont diffusés pour promouvoir la gestion intégrée des pestes	Diffuser les textes réglementaires Diffuser les listes des produits autorisés Promouvoir les mesures incitatives pour l'utilisation des méthodes de lutte intégrée Sensibiliser les différents acteurs	Nombre d'émissions produites Nombre d'exemplaire diffusés Nombre de séances organisées Type de facilité accordée	UGP	DPV AAAC	Sous l'activité et budget 1.1.3.b)
Promotion de la lutte intégrée et mesures techniques	lutte intégrée des pestes et pesticides est largement diffusés et appliquée	Organiser des sessions de renforcement de capacités techniques sur la gestion intégrée des pestes et pesticides pour les acteurs impliqués dans le projet notamment : les Directions régionales de la protection des végétaux ; le Comité national de gestion des pesticides (CNGP); les Directions régionales de l'environnement et du développement durable, les Directions régionales de l'agriculture, les Direction régionale de la gestion des infrastructures hydrauliques de l'agriculture, les représentants du gouvernement des régions,	Nombre de personnes formées sur la gestion intégrée des pestes et pesticides	UGP	AAAC DPV DGA	Confère activités et budgets : 1.2.1.d) 1.2.4, 2.1.3.7

Le coût du Plan de gestion intégrée des pestes et pesticides intégrée dans le CGES et dans les composantes et budget du projet.

CONCLUSION

Le développement des activités agricoles est susceptible d'accroître l'usage des pesticides et des engrais chimiques. Or, dans la situation actuelle, la gestion de ces produits nocifs à l'environnement et à l'Homme présente plusieurs défaillances.

Au plan législatif et réglementaire, des textes sont élaborés par le pays concernant la gestion, l'utilisation, l'agrément et le contrôle des produits phytosanitaires. Malheureusement lesdits documents législatifs sont très peu diffusés et mal connus du public. Au plan technique, les agents de la DPV en charge de la gestion des pestes et pesticides en agriculture ne sont pas suffisamment formés pour apporter un appui efficace aux producteurs.

Le présent plan de gestion intégrée des pestes et pesticides vise à préconiser l'ensemble des mesures permettant de promouvoir l'utilisation des méthodes de contrôle biologique ou environnemental afin d'éviter au maximum le recours aux pesticides chimiques et de s'assurer que les risques sanitaires et environnementaux associés aux pesticides sont minimisés.

A cet effet, la gestion des pesticides interpelle plusieurs acteurs qui ont des missions différentes mais qui visent un même objectif, à savoir une utilisation raisonnée et rationnelle pour la préservation de la santé et de l'environnement. Aussi, la mise en place d'un cadre de concertation, d'échange et d'action, à travers les activités du projet, permettra de créer les conditions d'une synergie entre les différentes interventions sectorielles « Agriculture-Environnement-Santé-Laboratoire de recherche »

Dans le cadre de ces activités, le présent PGIPP constitue une contribution pour impulser une dynamique nationale visant à :

- renforcer les capacités techniques sur la gestion intégrée des pestes et pesticides ;

- promouvoir les principes et mesures de gestion intégrée des pesticides avec l'ensemble des acteurs ;
- apporter un appui technique effectif dans la gestion intégrée des pestes et pesticides ;
- renforcer l'information, la formation et la sensibilisation des acteurs sur l'importance de la gestion intégrée des pestes et pesticides dans l'amélioration de la protection de la santé humaine et de l'environnement.

Le Projet doit accorder une attention particulière au suivi des différentes composantes environnementales et sociales dans sa zone d'intervention. Ce suivi doit être fait par les services de la Direction de la Protection des Végétaux (DPV) en collaboration avec les autres structures impliquées dans : (i) la gestion de l'environnement ; (ii) le développement agricole ; (iii) la protection des ressources naturelles, (iv) le suivi et contrôle des mouvements des pesticides ; (v) des institutions de recherche et d'analyses physico-chimiques, etc.

Pour permettre une mise en œuvre adéquate des résultats de la présente étude, les mesures de gestion intégrée de pestes et pesticides ont été intégrées dans les composantes du projet et budgétisées.

B.1. Politiques de la BOAD

- Politique opérationnelle en matière d'Etude d'impact environnemental et social
- Politique opérationnelle sur la Lutte antiparasitaire
- Politique opérationnelle en matière de participation du public dans le processus d'étude d'impact environnemental et social
- Manuel de politique de diffusion et d'accès à l'information

B.2. Directives opérationnelles de la BOAD

- Gestion des terres et des ressources en eau
- Lutte intégrée contre les parasites et emploi de produits chimiques agricoles
- Projets d'Irrigation et de drainage
- Gestion de la production agricole
- Santé et sécurité publique
- Renforcement des capacités

B.3. Document juridique

- Réglementation commune aux Etats membres du CILSS sur l'homologation des pesticides
- Règlement C/REG.3/5/2008 portant sur l'harmonisation des règles régissant l'homologation des pesticides dans l'espace CEDEAO.
- Décret – Loi n° 7/2000 du 24 aout qui définit un encadrement technique et scientifique de l'utilisation des produits phytopharmaceutiques

**Annexe 2 : Liste des pesticides de classe III et U autorisés
par le CSP et éligibles dans le cadre du projet**

Liste des pesticides de classe III et U autorisés par le CSP (Version de Mais 2015) et éligible dans le cadre du projet

N°	Spécialité commerciale	Classe OMS	Firme	Matière(s) active(s)	Numéro et date d'expiration	Domaines d'utilisation
1	AKIZON 40 SC	III	ARYSTA LIFESCIENCE	nicosulfuron (40 g/l)	0497-H0/He-12/HOM-SAHEL Expire en Juin 2017	Herbicide autorisé contre les graminées et les dicotylédones du maïs
2	ALLIGATOR ^R	III	SCPA SIVEX INTERNATION AL (SSI)	pendimethaline (400 g/l)	0502-H0/He/05-14/HOM-SAHEL Expire Mais 2019	Herbicide de pré-levée sélectif autorisé contre les mauvaises herbes sur le maïs
3	ANTOUKA 19 DP	III	SCPA SIVEX INTERNATION AL	Pirimiphos-méthyl (16g/kg)/ permethrine (3g/kg)	0804-A0/In/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide en traitement des denrées alimentaires
4	ANTRACOL 70 WP	III	BAYER CROPSCIENCE AG	propineb (700g/kg)	0823-A0/Fo/11-14/APV-SAHEL Expire en Novembre 2017	Fongicide de contact à action préventive autorisé contre de nombreuses maladies (midiou, altermariose, anthracnose...) de la tomate
5	AQUATAIN AMF	III	AQUATAIN PRODUCTS PIY LTD	silicone (80%)	0748-A0/IN/05-13/APV-SAHEL Expire en Mai 2016	Insecticide autorisé pour lutter contre les femelles en ponte, les larves et les pupes de moustiques
6	APRON STAR 42 WS	III	SYNGENTA	thiamethoxam (200 g/kg)/ mefenoxam (200g/kg)/ difenoconazole (20g/kg)	0297-H1/In,Fo/01-15/HOM-SAHEL Expire en Janvier 2020	Insecticide/fongicide autorisé contre les insectes et maladies du sol en traitement de semences des cultures
7	AZOX	III	SAVANA	azoxystrobine (250g/l)	0762-A0/Fo/11-13/APV-SAHEL Expire en Novembre 2016	Fongicide semi-systématique autorisé contre la pyriculariose foliaire et paniculaire en culture de riz
8	BACCARA	III	ARYSTA LIFESCIENCE	propanil (260g/l)	0613-A1/He/11-13/APV-SAHEL Expire en Novembre 2016	Herbicide autorisé en post levée contre les adventices du riz
9	BARAKA 432 EC	III	TOPEX AGRO ELEVAGE DEVELOPPEMENT	propanil 360g/l)/ triclolyr(72g/l)	0639-A0/He/11-13/APV-SAHEL Expire en Novembre 2016	Herbicide sélectif autorisé contre les adventices annuelles et pluriannuels du riz
10	BATIK WG	III	ARYSTA LIFESCIENCE	<i>Bacillus thuringiensis</i> (32.000 UI/mg)	0614-A1/In/11-13/APV-SAHEL	Insecticide autorisé des chenilles du chou

					Expire en Novembre 2016	
11	CALLIFOR G	III	ARYSTA LIFESCIENCE	prométryne (250 g/l) fluométuron (250 g/l) glyphosate (60 g/l)	0408-H1/He/05-13/HOM-SAHEL Expire en Mai 2018	Herbicide systématique du cotonnier autorisé en pré-levée de la culture et des adventices
12	CALLIFOR 500 SC	III	ARYSTA LIFESCIENCE	fluométuron (250 g/l) prométryne (250 g/l)	0388-H1/He/05-13/HOM-SAHEL Expire en Mai 2018	Herbicide systématique du cotonnier autorisé en pré-levée de la culture et des adventices
13	CALLISTAR 250 EC	III	ARYSTA LIFESCIENCE	Oxadiazon (250 g/l)	0615-A1/He/11-13/APV-SAHEL Expire en Novembre 2016	Herbicide sélectif autorisé contre les adventices du riz irrigué ou pluvial
14	CAMIX 500 SE	III	SYNGENTA CROP PROTECTION AG	Mésotrione (83,3 g/l)/ S-métolachlore (416,7 g/l)	0606-A1/He/06-13/APV-SAHEL Expire en Juin 2016	Herbicide autorisé en pré-levée ou post-levée précoce contre les adventices du maïs
15	COGA 80 WP	III	SAVANA	Mancozeb (800 g/kg)	0698-A0/Fo/11-12/APV-SAHEL Expire en Novembre	Fongicide de contact à large spectre pour les cultures maraichères, fruitières, vivrières et florales
16	CORAGEN 20 SC	IV	ALM INTERNATION AL	Chlorantraniliprole (200 g/l)	0781-A0/In/05-14/APV-SAHEL Expire Mai 2017	Insecticide autorisé contre les chenilles phylophages et coprophages et contre les insectes piqueurs-suceurs
17	CRUISER EXTRA COTON 362 FS	III	SYNGENTA CROP PROTECTION AG	thiamethoxam (350 g/l)/ fludioxonyl (8,34 g/l)/ metalaxyl-m (3,34 g/l)	0643-A1/In,Fo/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide fongicide autorisé pour le traitement des semences contre les insectes et les champignons
18	CYPERCAL 50 EC	III	ARYSTA LIFESCIENCE	cyperméthrine (50 g/l)	0216-H1/In/06-15/HOM-SAHEL Expire en Juin 2020	Insecticide autorisé contre les insectes ravageurs de la tomate
19	DEKADE 720 SL	III	ENTREPRISE MULTI SERVICES DU BURKINA FASO (EMUS BF)	Sel de 2,4-dimethyl amine (720 g/l)	0735-A0/He/11-14/APV-SAHEL Expire en Novembre 2017	Herbicide de post-levée contre un large spectre de graminées adventices en culture céréalière
20	DOYEN 62	III	SCPA SIVEX INTERNATION AL (SSI)	Emamectine benzoate (12 g/l) imidaclopride (50 g/l)	0734-A0/In/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide autorisé contre les chenilles, carpophages et les insectes piqueurs suceurs de la tomate
21	FINISH 360 SL	III	SAVANA	glyphosate (360 g/l)	0480-H0/He/11-11/HOM-SAHEL Expire en Novembre 2016	Herbicide systématique on sélectif autorisé contre les mauvaises herbes annuelles et pérennes avant plantation

22	PROPA 360	III	SCPA SIVEX INTERNATIONAL (SSI)	propanil (360 g/l)	0695-A0/He/11-12/APV-SAHEL Expire en Novembre 2015	Herbicide de post-levée sélectif du riz contre les mauvaises herbes annuelles
23	FENICAL 3 DP	III	ARYSTA LIFESCIENCE	Fénitrothion (3 g/kg)	0455-H0/In/11-11/HOM-SAHEL Expire en Novembre 2016	Insecticide autorisé contre les acridiens
24	FENICAL 400 UL	III	ARYSTA LIFESCIENCE	Fénitrothion (400 g/l)	0456-H0/In/11-11/HOM-SAHEL Expire en Novembre 2016	Insecticide autorisé contre les acridiens
25	FYFANON 880 EC	III	CHEMINOVA	Malathion (880 g/l)	0495-A0/X1/In/05-15/APV-SAHEL Expire en Mai 2018	Insecticide acaricide autorisé en culture de tomate contre <i>Bemisia tabaci</i> , <i>Aphis gossypii</i> , <i>Helicoverpa armigera</i> , <i>Spodoptera exigua</i> et les sauteriaux
26	GALAXY 450 EC	III	FMC	Clomazone (150 g/l) Pendiméthaline (300 g/l)	0366-H0/He/11-11/HOM-SAHEL Expire en Novembre 2016	Herbicide autorisé prélevée contre les adventices annuels du cotonnier et du riz
27	HERBALM 720 SL	III	ALM INTERNATIONAL	2,4-D amine (720 g/l)	0377-A1/He/05-14/APV-SAHEL	Herbicide sélectif autorisé contre les mauvaises herbes à feuilles larges du riz
28	KART 500 SP	III	SCPA SIVEX INTERNATIONAL (SSI)	Cartap (500 g/kg)	0585-A1/In/01-13/APV-SAHEL Expire en Janvier 2016	Insecticide autorisé contre les insectes ravageurs du chou
29	LASER 480 SC	III	DOW AGROSCIENCES	Spinosad (480g/l)	0265-H0-X1/In/11-14/HOM-SAHEL Expire en Novembre 2019	Insecticide autorisé dans la lutte contre les insectes nuisibles du chou et contre <i>Helicoverpa armigera</i> sur tomate
30	MAIA 75 WG	III	ALM INTERNATIONAL	Nicosulfuron (750 g/kg)	0646-A1/He/11-14/APV-SAHEL Expire en Novembre 2017	Herbicide sélectif autorisé contre les graminées annuelles vivaces et dicotylédones en culture du maïs
31	MARIGOLD	III	ARYSTA LIFESCIENCE	Thyme oil (5,55 g/l)/ tagetes oil (5,52 g/l)	0685-A1/In/06-15/APV-SAHEL Expire en Juin 2018	Insecticide biologique autorisé contre les mouches blanches de la tomate
32	MOMTAZ 45 WS	III	SAVANA	Imidaclopride (250 g/kg)/ thirame (200 g/kg)	0559-H0/In,Fo/11-14/HOM-SAHEL Expire en Novembre 2019	Insecticide/fongicide autorisé en traitement de semences contre les insectes et les champignons pathogènes du sol
33	NATIVO 300 SC	III	BAYER CROPSCIENCE AG	Tébuconazole (200 g/l) Trifloxystrobine (100 g/l)	0822-A0/Fo/11-14/APV-SAHEL Expire en Novembre 2017	Fongicide autorisé contre l'alternariose, la rouille, l'oïdium, la fusariose sur la tomate

34	NICODAF	III	ETS SDAGRI	Nicosulfuron (40 g/l)	0800-A0/He/11-14/APV-SAHEL	Herbicide autorisé contre les adventices du maïs
					Expire en Novembre 2017	
35	ORTIVA 250 SC	III	SYNGENTA CROP PROTECTION AG	Azoxystrobin (250 g/l)	0547-A1/Fo/11-14/APV-SAHEL	Fongicide systématique autorisé contre les maladies des cultures maraichères
					Expire en Novembre 2017

					Expire en Mai 2018	
48	2. KD SUPER 720 SL	III	RMG COTE D'IVOIRE	2.4,D sel d'amine (720 g/l)	0815-A0/He/05-15/APV-SAHEL	Herbicide sélectif de post-levée efficace contre les dicotylédones annuelles et pérennes en culture de riz pluvial et irrigué
					Expire en Mai 2018	

Annexe 3 : Principes de base de la lutte intégrée

Principes de base de lutte intégrée

PRINCIPES	MISE EN ŒUVRE	RESULTATS
Principe 1 Obtenir et planter du matériel végétal de qualité	Choisissez des semences, des boutures, des tubercules, ou des rejets provenant de variétés très productives, saines et résistantes aux ravageurs/maladies. Pour obtenir les semences certifiées, adressez-vous à des semenciers homologués ou à des centres nationaux de recherche. Les agriculteurs pourront planter du matériel prélevé sur des plants sains, issus de la campagne précédente. Ne stockez pas le matériel de plantation plus d'une saison. Effectuez des tests sommaires de germination.	L'utilisation de matériel de plantation de qualité permettra d'obtenir une culture saine et productive et, par conséquent, une récolte de qualité. Les variétés certifiées sont souvent résistantes à plusieurs ravageurs et maladies. Rappelez-vous l'adage populaire selon lequel les bonnes semences font les bonnes récoltes.
Principe 2 Choisir des sols fertiles et des lieux adaptés à la plantation	Sélectionnez des sols à bon drainage naturel, adaptés à la culture. Certaines cultures (le riz de bas-fond ou le riz irrigués, par exemple) préfèrent les sols submergés. Effectuez toujours la plantation dans des champs exempts de mauvaises herbes.	Les cultures ont besoin d'un maximum de gestion du sol et de l'eau pour se développer et rivaliser efficacement avec les adventices.
Principe 3 Adopter de bonnes pratiques en pépinière	Etablissez les pépinières sur un sol exempt de maladies pour favoriser le développement des plantules. Recouvrez le sol avec un paillis de feuilles de margousier ou d'herbe sèche. Bouturer uniquement le matériel sélectionné et exempt de ravageurs /maladies.	Après repiquage au champ, les plantules rigoureuses ainsi obtenues produiront des plants robustes.
Principe 4 Adopter les dispositifs et les dispositifs adéquats de plantation	Plantez en ligne, avec un écartement approprié, pour éviter une densité de peuplement excessive. La culture intercalaire se pratique généralement en lignes, en lignes alternées ou en bandes.	Une densité trop élevée entrave le développement de la culture et, en créant un environnement humide, favorise l'apparition des maladies. La plantation en ligne permet d'épargner des semences et de réaliser plus

PRINCIPES	MISE EN ŒUVRE	RESULTATS
		facilement les opérations agricoles comme le désherbage et la récolte. La culture intercalaire réduit la pression des insectes et garantit les rendements.
Principe 6 Pratiquer la rotation des cultures	Plantez successivement des cultures ne possédant pas des ravageurs en commun (rotation de céréales et de plantes à racines et tubercules avec des légumes ou des légumineuses par exemple). Plantez des plantes de couverture durant la période de jachère.	La rotation des cultures empêche la prolifération des maladies et des ravageurs terricoles (nématodes ou agents pathogènes par exemple). Les plantes de couverture enrichissent les sols et étouffent les mauvaises herbes.
Principe 7 Adopter de bonnes pratiques de conservation du sol	Recouvrez le sol avec du paillis, amendez la terre avec un compost ou un engrais organique et, si nécessaire, rectifier le bilan nutritif avec les engrais minéraux pour enrichir les sols peu fertiles. Fractionnez les apports d'engrais, notamment azotés, pour mieux répondre aux besoins de la culture.	Les sols pauvres sont enrichis à peu de frais pour stimuler la croissance et le développement des cultures saines et obtenir des rendements élevés. L'engrais est utilisé de manière économique.
Principe 8 Adopter les pratiques adéquates de gestion hydrique	Plantez dans des sols à bon drainage naturel (excepté pour le riz). Le cas échéant, construisez des canaux de drainage pour éliminer l'excès d'eau ; préparer les canaux de collecte d'eau (dans les plantations de bananiers plantains, par exemple) pour disposer d'une réserve d'eau suffisante. En condition irriguée, irriguez régulièrement les plantes selon les besoins.	La croissance et le développement de la culture ne sont pas compromis par le manque d'eau ; en outre, les plants ne souffrent pas d'engorgement.
Principe 9 Désherber régulièrement	Installez les cultures dans des champs exempts de mauvaises herbes. Pour empêcher la production de semences de mauvaises herbes, binez dans les trois semaines après la	Cette mesure permet d'épargner la main-d'œuvre et d'éviter de blesser les racines de la culture. La concurrence entre les cultures et les mauvaises herbes est éliminée ; ces derniers ne

PRINCIPES	MISE EN ŒUVRE	RESULTATS
	<p>plantation et sarcler superficiellement à la main jusqu'à la fermeture du couvert de la culture.</p> <p>Arrachez les premiers plants de Striga avant leur floraison et leur monté en graines.</p>	<p>parviennent pas à produire des graines. Les mauvaises herbes parasites ne peuvent s'établir dans les champs</p>
<p>Principe 10</p> <p>Inspecter régulièrement les champs</p>	<p>Inspectez les champs chaque semaine pour surveiller la croissance et le développement des cultures, suivre l'évolution des populations d'auxiliaire et détecter rapidement l'arrivée des ravageurs, les maladies et adventices ; effectuez une analyse de l'agro-écosystème (AESA) et prenez une décision sur les opérations culturales à réaliser.</p>	<p>L'inspection régulière des champs permet aux cultivateurs de détecter les problèmes et de mettre en œuvre les mesures de lutte intégrée nécessaire pour éviter une aggravation des dégâts et, par conséquent, des pertes importantes de rendement.</p>
<p>Principe 11</p> <p>Maintenir les champs parfaitement propres</p>	<p>Conservez toujours les champs dans un état de grande propreté. Éliminez tous les résidus (plantes de la campagne précédentes et résidus végétaux, par exemple) ; la plupart des résidus sont employés comme fourrage pour le bétail. Arrachez et détruisez les cultures présentant des symptômes de maladie en début de cycle végétatif. À l'issue de la récolte, éliminez les résidus de culture (fauchez-les et utilisez-les comme fourrage pour le bétail ou enfouissez-les)</p>	<p>Ces résultats empêchent la prolifération des ravageurs et les maladies et leur passage d'une campagne à l'autre. Les ravageurs et les maladies ne peuvent se propager à l'ensemble de l'exploitation.</p>
<p>Principe 12</p> <p>Lutter efficacement contre les ravageurs et les maladies</p>	<p>Adopte une stratégie sur la prévention et l'accroissement des populations auxiliaires. Évitez les moyens de lutte nocifs pour l'homme ou la culture ainsi que ceux qui dégradent l'environnement ; privilégier les méthodes mécaniques ou naturelles (extrait de graines/feuilles de margousier, solution savonneuse par exemple). Si le recours aux pesticides chimiques s'avère inévitable, (par exemple cas de forêts infestation de ravageurs, appliquer le produit adéquat aux</p>	<p>Les problèmes de ravageurs et les maladies sont circonscrits, autorisant une production élevée et durable, avec un minimum d'intrant coûteux. Les produits naturels sont moins onéreux et moins nocifs pour l'homme et l'environnement.</p>

PRINCIPES	MISE EN ŒUVRE	RESULTATS
	zones recommandées, selon la technique requise en respectant les mesures de précaution.	
Principe 13 Favoriser l'accroissement des populations d'ennemis naturels (auxiliaires)	Adopter des pratiques qui créent des conditions environnementales favorables à la reproduction des ennemis (utilisation minimale de pesticide de synthèse, emploi de producteurs d'origine végétale comme les extraits de margousier et paillage pour stimuler la reproduction des ennemis naturels comme les fourmis prédatrices, les araignées, les carabes, les syrphides et les coccinelles).	Les populations de ravageurs sont maîtrisées efficacement et naturellement par les importantes populations d'ennemis naturels. La maîtrise naturelle des ravageurs ne nuit ni à l'homme ni à l'environnement.
Principe 14 Réduire au minimum l'application de pesticides chimiques	Eviter l'application systématique et régulière des pesticides. En cas de besoin réel uniquement avec des pesticides sélectifs. Privilégiez les produits d'origine végétale. Abstenez-vous de traiter avec des produits phytopharmaceutiques dès l'apparition des premiers ravageurs ou des premiers symptômes. Analysez toujours l'agro-système (AESA) avant toute décision de traitement. En cas de pullulation des ravageurs et de dégâts importants, traitez avec des produits naturels (extraits de graines/feuilles de margousier ou solution savonneuse).	L'utilisation parcimonieuse de pesticides chimiques sélectifs permet aux populations d'auxiliaire (fourmis, prédatrices, araignées, mantes et coccinelles, par exemple) de se développer au détriment des ravageurs. Il s'agit d'une méthode naturelle de lutte contre les ravageurs
Principe 15 Adopter de bonnes pratiques de récolte	Récoltez les cultures dès leur maturité ; soyez prudent pour éviter de blesser, de déchirer, de casser ou de causer d'autres dégâts aux produits récoltés. Evitez de récolter ou de stocker des fruits et légumes en plein soleil.	Les cultivateurs obtiennent de meilleurs prix pour des produits propres et indemnes. Les produits indemnes se conservent plus facilement car ils ne présentent aucun point d'entrée aux ravageurs et aux agents pathogènes. Les produits fraîchement récoltés et maintenus à

PRINCIPES	MISE EN ŒUVRE	RESULTATS
		basse température se conservent plus longtemps.
<p>Principe 16</p> <p>Adopter des dispositifs de stockage propres et de qualité.</p>	<p>Les magasins sont toujours propres, sec et bien ventilés. Stockez uniquement des produits entiers. Conservez les récoltes dans des conteneurs hermétiques pour les protéger contre les ravageurs des greniers. En général, les dégâts causés par les ravageurs des stocks s'aggravent fortement après trois mois de stockage ; par conséquent, répartissez les récoltes en plusieurs lots selon la durée de conservation. Traitez uniquement les lots destinés à une conservation de longue durée (avec des produits adéquats comme de l'huile de margousier ou des pesticides recommandés pour les produits stockés).</p>	<p>La qualité des produits stockés est conservée pendant l'entreposage. Les produits stockés sont peu exposés aux attaques des ravageurs et des agents pathogènes. Les grains stockés restent secs. Les pesticides recommandés pour le traitement des stocks sont utilisés économiquement.</p>

Annexe 4 : Guide de bonnes pratiques de gestion des
pesticides.

A. Mesures requises pour la réduction des risques liés aux pesticides.

▪ Sécurité d'emploi des pesticides

Les pesticides sont toxiques pour les vermines mais aussi pour l'Homme. Cependant, si l'on prend des précautions suffisantes, il ne devrait constituer une menace ni pour la population, ni pour les espèces animales non visées. La plupart d'entre eux peuvent avoir des effets nocifs si on les avale ou s'ils restent en contact prolongé avec la peau. Lorsqu'on pulvérise un pesticide sous forme de fines particules, on risque d'en absorber avec l'air que l'on respire. Il existe en outre un risque de contamination de l'eau, de la nourriture et du sol. Des précautions particulières doivent être prises pendant le transport, le stockage et la manipulation des pesticides. Il faut nettoyer régulièrement le matériel d'épandage et bien l'entretenir pour éviter les fuites. Les personnes qui se servent de pesticides doivent apprendre à les utiliser en toute sécurité.

▪ Précautions

Etiquetage

Les pesticides doivent être emballés et étiquetés conformément aux normes de l'OMS. L'étiquette doit être rédigée en anglais et dans la langue du lieu; elle doit indiquer le contenu, les consignes de sécurité (mise en garde) et toutes dispositions à prendre en cas d'ingestion ou de contamination accidentelle. Toujours laisser le produit dans son récipient d'origine. Prendre les mesures de précaution voulues et porter les vêtements de protection conformément aux recommandations.

Stockage et transport

Conserver les pesticides dans un endroit dont on puisse verrouiller l'entrée et qui ne soit pas accessible aux personnes non autorisées ou aux enfants. En aucun cas les pesticides ne doivent être conservés en un lieu où l'on risquerait de les prendre pour de la nourriture ou de la boisson. Il faut les tenir au sec et à l'abri du soleil. On évitera de les transporter dans un véhicule servant aussi au transport de denrées alimentaires.

Afin d'assurer la sécurité dans le stockage et le transport, la structure publique ou privée en charge de la gestion des insecticides et supports imprégnés d'insecticides qui auront été acquis devra respecter la réglementation en vigueur ainsi que les conditions de conservation recommandée par le fabricant en relation avec :

- la conservation de l'étiquetage d'origine,
- la prévention des déversements ou débordements accidentels,
- l'utilisation de récipients appropriés,
- le marquage convenable des produits stockés,
- les spécifications relatives aux locaux,
- la séparation des produits,
- la protection contre l'humidité et la contamination par d'autres produits,
- la restriction de l'accès aux locaux de stockage,
- le magasin de stockage sous clé afin de garantir l'intégrité et la sécurité des produits.
- Les entrepôts de pesticides doivent être situés à distance des habitations humaines ou abris pour animaux, des sources d'eau, des puits et des canaux. Ils doivent être situés sur une hauteur et sécurisés par des clôtures, leur accès étant réservé aux personnes autorisées.

Il ne faut pas entreposer de pesticides dans des lieux où ils risquent d'être exposés à la lumière solaire, à l'eau ou à l'humidité, ce qui aurait pour effet de nuire à leur stabilité. Les entrepôts doivent être sécurisés et bien ventilés.

Il faut éviter de transporter dans un même véhicule des pesticides et des produits agricoles, des denrées alimentaires, des vêtements, des jouets ou des cosmétiques car ces produits pourraient devenir dangereux en cas de contamination.

Les récipients de pesticides doivent être chargés dans les véhicules de manière à ce qu'ils ne subissent pas de dommages pendant le transport, que leurs étiquettes ne soient pas arrachées et qu'ils ne viennent pas à glisser et à tomber sur une route dont le revêtement peut être irrégulier. Les véhicules qui transportent des pesticides doivent porter un panneau de mise en garde placé bien en évidence et indiquant la nature du chargement.

Distribution

La distribution doit s'inspirer des lignes directrices suivantes :

- L'emballage (emballage original ou nouvel emballage) doit garantir la sécurité pendant la distribution et éviter la vente ou la distribution non autorisées de produits destinés à la lutte anti-vectorielle ;

- le distributeur doit être informé et conscientiser de la dangerosité de son chargement ;
- le distributeur doit effectuer ses livraisons dans les délais convenus ;
- le système de distribution des insecticides et supports imprégnés doit permettre de réduire les risques liés à la multiplicité des manipulations et des transports ;
- si le département acquéreur n'est pas en mesure d'assurer le transport des produits et matériels, il doit être stipulé dans les appels d'offres que le fournisseur est tenu d'assurer le transport des insecticides et supports imprégnés jusqu'à l'entrepôt ;
- tous les distributeurs d'insecticides et matériels d'épandage doivent être en possession d'une licence d'exploitation.

B. Modes de traitement des contenants vides

Le traitement des contenants vides s'articule autour de deux opérations fondamentales : le Nettoyage, la décontamination et l'élimination à proprement parler.

Nettoyage des emballages et récipients vides de pesticides

Réutiliser des récipients de pesticides vides présente des risques et il est déconseillé de le faire. Toutefois, on peut estimer que certains récipients de pesticides sont trop utiles pour qu'on les jette purement et simplement après usage. Peut-on donc nettoyer et réutiliser de tels récipients ? Cela dépend à la fois du matériau et du contenu. En principe, l'étiquette devrait indiquer quelles sont les possibilités de réemploi des récipients et comment s'y prendre pour les nettoyer. Il ne faut en aucun cas réutiliser des récipients qui ont contenu des pesticides classés comme très dangereux ou extrêmement dangereux. Dans certaines conditions, les récipients de pesticides classés comme peu dangereux ou ne devant pas en principe présenter de danger en utilisation normale, peuvent être réutilisés à condition que ce ne soit pas pour contenir des aliments, des boissons ou de la nourriture pour animaux. Les récipients faits de matériaux comme le polyéthylène, qui absorbent préférentiellement les pesticides, ne doivent pas être réutilisés s'ils ont contenu des pesticides dont la

matière active est classée comme modérément, très ou extrêmement dangereuse, quelle que soit la formulation. Dès qu'un récipient est vide, il faut le rincer, puis le remplir complètement avec de l'eau et le laisser reposer pendant 24 heures. Ensuite, on le vide et on recommence deux fois l'opération.

La décontamination

Elle comprend trois étapes et concerne tous les récipients de pesticides :

- s'assurer de la vidange maximale du produit et égouttage pendant 30 secondes (le contenu est vidé dans un récipient à mélange, dans un verre pour le dernier dosage s'agissant de l'imprégnation) ;
- rincer le récipient au moins trois fois avec un volume d'eau qui ne doit pas être inférieur à 10% du volume total du récipient ;
- verser les eaux de rinçage dans un pulvérisateur, dans une fosse (imprégnation).

Un contenant décontaminé n'est cependant pas éligible pour le stockage de produits d'alimentation humaine ou animale ou d'eau pour la consommation domestique.

L'élimination

Sauf s'il est envisagé que les contenants soient récupérés, la première opération d'élimination consiste à les rendre inutilisables à d'autres fins : « conditionnement ». Aussi il faut veiller à faire des trous avec un outil pointu et aplanir le récipient lorsqu'il s'agit de bidons en métal et pour les fûts ; les bouteilles en verre doivent être classées dans un sac pour éviter les esquilles ; les plastiques sont déchiquetés et broyés. Les bondes ou capsules sont auparavant retirés.

Les récipients combustibles sont éliminés par voie de brûlage surveillé (emballages en papier et en plastique [les bidons en PVC ne devront pas être brûlés], carton) ou déposés dans une décharge publique acceptant les déchets toxiques de cette nature (mettre en pièces les bidons en plastique, en verre et en métal) ; les cendres résultant du brûlage à nu sont enfouies.

Cependant l'étiquette collée sur le récipient peut porter une mention déconseillant le brûlage.

En effet le brûlage par exemple de certains récipients d'herbicides (à base d'acide phénoxy) peut entraîner le dégagement de vapeurs toxiques pour l'homme ou la flore environnante.

Précautions : la combustion ne doit avoir lieu que dans des conditions où le vent ne risque pas de pousser la fumée toxique en direction des maisons d'habitation, de personnes, de bétail ou de cultures se trouvant à proximité, ni vers ceux qui réalisent l'opération.

Les grands récipients non combustibles 50 à 200l peuvent suivre les filières suivantes :

- renvoi au fournisseur,
- vente/récupération à/par une entreprise spécialisée dans le commerce des fûts et barils usagés possédant la technologie de neutralisation de la toxicité des matières adhérentes qui peut aussi procéder à leur récupération,
- évacuation vers une décharge contrôlée dont l'exploitant est informé du contenu des fûts et est prévenu du potentiel dégagement de vapeurs toxiques si on applique une combustion,
- évacuation vers un site privé, clôturé, gardienné, respectant les normes environnementales et utilisé spécifiquement pour les pesticides.

Les petits récipients non combustibles jusqu'à 20 l sont soit :

- acheminés vers la décharge publique,
- enfouis sur site privé après retrait des capsules ou couvercles, perforations des récipients, brisure des récipients en verre. La fosse de 1 à 1,5 m de profondeur utilisée à des fins d'enfouissement sera rempli jusqu'à 50 cm de la surface du sol et recouvert ensuite de terre. Le site sera éloigné des habitations et des points d'eau (puits, mares, cours d'eau), doit être non cultivé et ne sera pas en zone inondable ; la nappe aquifère doit se trouver à au moins 3 m de la surface du sol, la terre doit y être imperméable (argileuse ou franche). Le site sera clôturé et identifié.

C. Hygiène générale

Il ne faut ni manger, ni boire, ni fumer lorsqu'on manipule des insecticides. La nourriture doit être rangée dans des boîtes hermétiquement fermées. La mesure, la dilution et le transvasement des insecticides doivent s'effectuer avec le matériel adéquat. Ne pas agiter ni prélever des liquides les mains nues. Si la buse s'est bouchée, agir sur la vanne de la pompe ou dégager l'orifice avec une tige souple. Après chaque remplissage, se laver les mains et le visage à l'eau et au savon. Ne boire et ne manger qu'après s'être lavé les mains et le visage.

Prendre une douche ou un bain à la fin de la journée.

D. Protection Individuelle

- Combinaison adaptée couvrant toute la main et tout le pied.
- Masques anti-poussière anti-vapeur ou respiratoire selon le type de traitement et de produit utilisé.
- Gants.
- Lunettes.
- Cagoules (écran facial).
- Protection des populations
- Réduire au maximum l'exposition des populations locales et du bétail.
- Couvrir les puits et autres réserves d'eau.
- Sensibiliser les populations sur les risques.
-

E. Vêtements de protection

Traitements à l'intérieur des habitations

Les opérateurs doivent porter une combinaison de travail ou une chemise à manches longues par-dessus un pantalon, un chapeau à large bord, un turban ou autre type de couvre-chef ainsi que des bottes ou de grosses chaussures.

Les sandales ne conviennent pas. Il faut se protéger la bouche et le nez avec un moyen simple, par exemple un masque jetable en papier, un masque chirurgical jetable ou lavable ou un chiffon de coton propre. Dès que le tissu est humide, il faut le changer. Les vêtements doivent également être en coton pour faciliter le lavage et le séchage. Ils doivent couvrir le corps et ne comporter aucune ouverture. Sous les climats chauds et humides, il peut être inconfortable de porter un vêtement protecteur supplémentaire, aussi s'efforcera-t-on d'épandre les pesticides pendant les heures où la chaleur est la moins forte.

Préparation des suspensions

Les personnes qui sont chargées d'ensacher les insecticides et de préparer les suspensions, notamment au niveau des unités d'imprégnation des moustiquaires, doivent prendre de précautions spéciales. Outre les vêtements de protection mentionnés ci-dessus, elles doivent porter des gants, un tablier et une protection oculaire, par exemple un écran facial ou des lunettes. Les écrans faciaux protègent la totalité du visage et tiennent moins chaud. Il faut se couvrir la bouche et le nez comme indiqué pour les traitements à l'intérieur des habitations.

On veillera en outre à ne pas toucher une quelconque partie de son corps avec les gants pendant la manipulation des pesticides.

Imprégnation des tissus

Pour traiter les moustiquaires, les vêtements, les grillages ou les pièges à glossines avec des insecticides, il est impératif de porter de longs gants de caoutchouc. Dans certains cas, une protection supplémentaire est nécessaire, par exemple contre les vapeurs, les poussières ou les aspersion d'insecticides qui peuvent être dangereux. Ces accessoires de protection supplémentaires doivent être mentionnés sur l'étiquette du produit et peuvent consister en tabliers, bottes, masques faciaux, combinaisons et chapeaux.

Entretien

Les vêtements de protection doivent toujours être impeccablement tenus et il faut procéder à des contrôles périodiques pour vérifier qu'il n'y a ni déchirures ni usures du tissu qui pourraient entraîner une contamination de l'épiderme. Les vêtements et les équipements de protection doivent être lavés tous les jours à l'eau et au savon, séparément des autres vêtements. Les gants doivent faire

l'objet d'une attention particulière et il faut les remplacer dès qu'ils sont déchirés ou s'ils présentent des signes d'usure. Après usage, on devra les rincer à grande eau avant de les ôter. A la fin de chaque journée de travail, il faudra les laver à l'extérieur et à l'intérieur.

F. Mesures de sécurité

Lors des pulvérisations

Le jet qui sort du pulvérisateur ne doit pas être dirigé vers une partie du corps. Un pulvérisateur qui fuit doit être réparé et il faut se laver la peau si elle a été accidentellement contaminée. Les occupants de la maison et les animaux doivent rester dehors pendant toute la durée des opérations. On évitera de traiter une pièce dans laquelle se trouve une personne un malade par exemple que l'on ne peut pas transporter à l'extérieur. Avant que ne débutent les pulvérisations, il faut également sortir tous les ustensiles de cuisine, la vaisselle et tout ce qui contient des boissons ou des aliments. On peut aussi les réunir au centre d'une pièce et les recouvrir d'une feuille de plastique. Les hamacs et les tableaux ou tentures ne doivent pas être traités. S'il faut traiter le bas des meubles et le côté situé vers le mur, on veillera à ce que les autres surfaces soient effectivement traitées. Il faut balayer le sol ou le laver après les pulvérisations. Les occupants doivent éviter tout contact avec les murs. Les vêtements et l'équipement doivent être lavés tous les jours. Il faut éviter de pulvériser des organophosphorés ou des carbamates plus de 5 à 6 heures par jour et se laver les mains après chaque remplissage.

Surveillance de l'exposition aux organophosphorés

Il existe dans le commerce des trousse de campagne pour contrôler l'activité du cholinestérase sanguine. Si cette activité est basse, on peut en déduire qu'il y a eu exposition excessive à un insecticide organophosphoré. Ces dosages doivent être pratiqués toutes les semaines chez toutes les personnes qui manipulent de tels produits. Toute personne dont l'activité cholinestérasique est trop basse doit être mise en arrêt de travail jusqu'à retour à la normale.

Imprégnation des tissus

Lorsqu'on manipule des concentrés d'insecticides ou qu'on prépare des suspensions, il faut porter des gants. Il faut faire attention surtout aux projections

dans les yeux. Il faut utiliser une grande bassine pas trop haute et il faut que la pièce soit bien aérée pour que l'on ne risque pas d'inhaler les fumées.

**Annexe 5 : Liste Globale des pesticides autorisés par le
Comité sahélien des pesticides (CSP)**

Liste globale des pesticides autorisés par le CSP Version de Mai 2015

N°	Spécialité commerciale	Classe OMS	Firme	Matière(s) active(s)	Numéro et date d'expiration	Domaines d'utilisation
1	ABSOLUT 90 WG	U	ARYSTA LIFE SCIENCE	fluométuron (900 g/kg)	0693-A0/He/05-14/APV-SAHEL Expire Mai 2017	Herbicide systémique à large spectre, sélectif du cotonnier
2	ACARIUS	II	SAVANA	abamectine (18 g/l)	0697-A1/In,Ac/06-15/APV-SAHEL Expire en Juin 2018	Insecticide / Acaricide autorisé contre les insectes et les acariens en cultures maraichères
4	ACEPRONET 400 EC	III	DTE	acétochlore (250 g/l) / prométryne (150 g/l)	0550-A1/He/06-13/APV-SAHEL Expire en Juin 2016	Herbicide autorisé en post semis pré-levée contre les adventices du cotonnier
5	ACTELIC 50 EC	III	SYNGENTA CROP PROTECTION AG	pirimiphos-méthyl (50 g/l)	0167-A1/In/01-13/APV-SAHEL Expire en Janvier 2016	Insecticide autorisé en santé publique contre les insectes volants et les insectes rampants.
6	ACTELIC 300 CS	U	SYNGENTA CROP PROTECTION AG	pirimiphos-méthyl (300 g/l)	0747-A0/In/11-13/APV-SAHEL Expire en Novembre 2016	Insecticide autorisé en santé publique contre les insectes volants et les insectes rampants
7	ACTELIC SUPER DUST	III	SYNGENTA CROP PROTECTION AG	perméthrine (3 g/kg) / pirimiphos-méthyl (16 g/kg)	0649-A1/In/05-14/APV-SAHEL Expire Mai 2017	Insecticide autorisé contre les insectes ravageurs des denrées stockées
8	ACTELIC GOLD DUST	U	SYNGENTA CROP PROTECTION AG	pyrimiphos méthyl (16 g/kg) thiaméthoxam (3,6 g/kg)	0813-A0/In/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide utilisé pour la protection des denrées stockées
9	ACTION 80 DF	III	SCPA SIVEX INTERNATIONAL (SSI)	diuron (800 g/kg)	0320-H0/He/11-11/HOM-SAHEL Expire en Novembre 2016	Herbicide autorisé en prélevée contre les dicotylédones annuelles et certaines graminées du cotonnier
10	AGIL 100 EC	III	ADAMA AGAN LTD.	propaquizafop (100 g/l)	0475-H0/He/11-12/HOM-SAHEL Expire en Novembre 2017	Herbicide de post levée autorisé contre les graminées annuelles et pérennes du cotonnier
11	AKIZON 40 SC	III	ARYSTA LIFESCIENCE	nicosulfuron (40 g/l)	0497-H0/He/06-12/HOM-SAHEL Expire en Juin 2017	Herbicide autorisé contre les graminées et les dicotylédones du maïs

Liste globale des pesticides autorisés par le CSP Version de Mai 2015

N°	Spécialité commerciale	Classe OMS	Firme	Matière(s) active(s)	Numéro et date d'expiration	Domaines d'utilisation
12	ALADIN	Ib	SAVANA	phosphure d'aluminium (560 g/kg)	0806-A0/In/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide fumigant à usage professionnel pour la protection des denrées stockées
13	ALLIGATOR ^R	III	SCPA SIVEX INTERNATIONAL (SSI)	pendimethaline (400 g/l)	0502-H0/He/05-14/HOM-SAHEL Expire Mai 2019	Herbicide de pré-levée sélectif autorisé contre les mauvaises herbes sur le maïs
14	ALLIGATOR ^R	III	SCPA SIVEX INTERNATIONAL (SSI)	pendimethaline (400 g/l)	0502-A0-X1/He/05-14/APV-SAHEL Expire Mai 2017	Herbicide de pré-levée sélectif autorisé contre les mauvaises herbes sur le cotonnier
15	ALMECTINE 20 EC	II	ALM INTERNATIONAL	emamectine benzoate (20 g/l)	0784-A0/In/05-14/APV-SAHEL Expire Mai 2017	Insecticide autorisé contre les ravageurs du cotonnier
16	ASULOX	III	ALM INTERNATIONAL	asulam (400 g/l)	0783-A0/He/05-14/APV-SAHEL Expire Mai 2017	Herbicide autorisé en post-levée de la canne à sucre
17	ANTOUKA 19 DP	III	SCPA SIVEX INTERNATIONAL	pirimiphos-méthyl (16g/kg) / permethrine (3 g/kg)	0804-A0/In/11-14/APV-SAHEL Expire en Novembre 2017	Insecticide en traitement des denrées alimentaires
18	ANTRACOL 70 WP	III	BAYER CROPS SCIENCE AG	propineb (700 g/kg)	0823-A0/Fo/11-14/APV-SAHEL Expire en Novembre 2017	Fongicide de contact à action préventive autorisé contre de nombreuses maladies (mildiou, alternariose, anthracnose...) de la tomate
19	AQUATAIN AMF	III	AQUATAIN PRODUCTS PTY LTD	silicone (80%)	0748-A0/In/05-13/APV-SAHEL Expire en Mai 2016	Insecticide autorisé pour lutter contre les femelles en ponte, les larves et les pupes de moustiques
20	APRON STAR 42 WS	III	SYNGENTA	thiamethoxam (200 g/kg) / mefenoxam (200 g/kg) / difenoconazole (20 g/kg)	0297-H1/In,Fo/01-15/HOM-SAHEL Expire en Janvier 2020	Insecticide / fongicide autorisé contre les insectes et maladies du sol en traitement de semences des cultures
21	ATTAKAN C 344 SE	II	ARYSTA LIFESCIENCE	cyperméthrine (144 g/l) / imidacloprid (200 g/l)	0496-H0/In/06-12/HOM-SAHEL Expire en Juin 2017	Insecticide autorisé contre les chenilles phylophages, carponphages et les pucerons du cotonnier

Liste globale des pesticides autorisés par le CSP Version de Mai 2015

N°	Spécialité commerciale	Classe OMS	Firme	Matière(s) active(s)	Numéro et date d'expiration	Domaines d'utilisation
